

## EXPERIMENT NO. 01

**AIM:** To study the operation of CRO and DSO (Digital oscilloscope).

### APPARATUS REQUIRED:

CRO( Cathode Ray Oscilloscope) , DSO( Digital Storage Oscilloscope) , probes, power supply.

### THEORY:

**Cathode Ray Oscilloscope:** The oscilloscope counts among the important measuring instruments in experimental physics. It makes it possible to observe and to measure quantitatively the course of an electric voltage  $U(t)$  as a function of time or as a function of voltage  $U(X)$  in „real-time“. The temporal course of all physical quantities that can be converted to an electrical voltage using a suitable measurement device can be displayed with an oscilloscope. There are few restrictions regarding the amplitude and frequency of the measurable signals; if you are prepared to spend enough money, you will certainly find an oscilloscope which meets the requirements.

During the introductory laboratory course, too, the oscilloscope is a frequently used measuring

instrument. In some experiments it is a fundamental component of the experimental set-up and yields the quantitative data required for the analysis. In other experiments it is used for qualitative control, i.e., whether a circuit has been correctly set up and is operative, if a sensor is providing the correct signal, ... In order to perform the following experiments successfully, a thorough knowledge of the oscilloscope is imperative. The experiments described in this document are divided into two laboratory sessions.

### XY- and XT-operation:

The oscilloscope can operate in different modes depending on the setting of the switch of the MODE function group: In *XY operation* the signal course will be displayed in  $U(X)$ . To produce this, the signal from input CH1 (X) passes an output amplifier and arrives as voltage  $U(X)$  on the X deflection plate, and the signal from input CH2 (Y) passes an output amplifier and arrives as voltage  $U(Y)$  on the Y deflection plate.

□ The *XT operational mode* displays signals as a function of time  $t$ :  $I_1(t)$ ,  $I_2(t)$ , or  $I_1(t) + I_2(t)$ . To produce this, the signals CH1 ( $I_1(t)$ ) and CH2 ( $I_2(t)$ ), respectively arrive at the Y deflection plate after amplification, while a sweep generator produces a *saw tooth voltage*
