

## Introduction to Pre – Calculus

Analytic Geometry is a unified algebra dealing with the study of relationships between different geometric figures and equations by means of the geometric properties and processes of algebra in relation to a coordinate system. This unit introduces the Four Types of Conic Sections namely the Circle, Parabola, Ellipse and Hyperbola.

### Division of Analytic Geometry

#### 1. Plane Analytic Geometry

Deals with the study of points, curves and planes in a two-dimensional coordinate system

#### 2. Solid Analytic Geometry

Deals with the study of points, curves, surfaces and solid that is, in a three-dimensional coordinate system.

## An Overview of Conic Sections

We introduce the conic sections (or conics), a particular class of curves which oftentimes appear in nature and which have applications in other fields. One of the first shapes we learned, a circle, is a conic. When you throw a ball, the trajectory it takes is a parabola. The orbit taken by each planet around the sun is an ellipse. Properties of hyperbolas have been used in the design of certain telescopes and navigation systems.

Figure 1. Parts of a Cone

Any figure that can be obtained by slicing a double cone is called a conic section. Depending on the angle of the plane with respect to the cone, a conic section may be a circle, an ellipse, a parabola, or a hyperbola.

- ❖ Circle - when the plane is horizontal
- ❖ Ellipse - when the (tilted) plane intersects
- ❖ Parabola - when the plane intersects only one cone to form an unbounded curve
- ❖ Hyperbola – when the plane (not necessarily vertical) intersects both cones to form two unbounded curves (each called a branch of the hyperbola)
