Jähnichen, 2004-01-27 ETAPS 99 is the second instance of the European Joint Conferences on Theory and Practice of Software. ETAPS is an annual federated conference that was established in 1998 by combining a number of existing and new conferences. This year it comprises five conferences: FOSSACS, FASE, ESOP, CC, TACAS, four satellite workshops: CMCS, AS, WAGA, CoFI, seven invited lectures, two invited tutorials and six contributed tutorials. The events that comprise ETAPS address various aspects of the system development process including specification, design, implementation, analysis and improvement. The languages, methodologies and tools which support these activities are all well within its scope. Different blends of theory and practice are represented with an inclination towards theory with a practical motivation on one hand and soundly based practice on the other. Many of the issues involved in software design apply to systems in general including hardware systems and the emphasis on software is not intended to be exclusive.

Compiler Construction Rastislav Bodik, 2005-03-10 ETAPS 2005 was the eighth instance of the European Joint Conferences on Theory and Practice of Software. ETAPS is an annual federated conference that was established in 1998 by combining a number of existing and new conferences. This year it comprised five conferences: CC, ESOP, FASE, FOSSACS, TACAS, 17 satellite workshops: AVIS, BYTECODE, CEES, CLASE, CMSB, COCV, FAC, FESCA, FINCO, GCW, DSE, GLPL, LDTA, QAPL, SC, SLAP, TGC, UITP, seven invited lectures (not including those that were specific to the satellite events) and several tutorials. We received over 550 submissions to the five conferences this year giving acceptance rates below 30% for each one. Congratulations to all the authors who made it to the final program. I hope that most of the other authors still found a way of participating in this exciting event and I hope you will continue submitting.

Compiler Construction William M. Waite, Gerhard Goos, 2012-12-06 Compilers and operating systems constitute the basic interfaces between a programmer and the machine for which he is developing software. In this book we are concerned with the construction of the former. Our intent is to provide the reader with a firm theoretical basis for compiler construction and sound engineering principles for selecting alternate methods, implementing them and integrating them into a reliable, economically viable product. The emphasis is upon a clean decomposition employing modules that can be re-used for many compilers, separation of concerns to facilitate team programming and flexibility to accommodate hardware and system constraints. A reader should be able to understand the questions he must ask when designing a compiler for language X on

machine Y what tradeoffs are possible and what performance might be obtained He should not feel that any part of the design rests on whim each decision must be based upon specific identifiable characteristics of the source and target languages or upon design goals of the compiler The vast majority of computer professionals will never write a compiler Nevertheless study of compiler technology provides important benefits for almost everyone in the field It focuses attention on the basic relationships between languages and machines Understanding of these relationships eases the inevitable transitions to new hardware and programming languages and improves a person's ability to make appropriate tradeoffs in design and implementation

Compiler Construction Oege de Moor, Michael I. Schwartzbach, 2009-03-09 This book constitutes the refereed proceedings of the 18th International Conference on Compiler Construction CC 2009 held in York UK in March 2009 as part of ETAPS 2009 the European Joint Conferences on Theory and Practice of Software Following a very thorough review process 18 full research papers were selected from 72 submissions Topics covered include traditional compiler construction compiler analyses runtime systems and tools programming tools techniques for specific domains and the design and implementation of novel language constructs

Software Design for Engineers and Scientists John Allen Robinson, 2004-08-21 Software Design for Engineers and Scientists integrates three core areas of computing Software engineering including both traditional methods and the insights of extreme programming Program design including the analysis of data structures and algorithms Practical object oriented programming Without assuming prior knowledge of any particular programming language and avoiding the need for students to learn from separate specialised Computer Science texts John Robinson takes the reader from small scale programming to competence in large software projects all within one volume Copious examples and case studies are provided in C The book is especially suitable for undergraduates in the natural sciences and all branches of engineering who have some knowledge of computing basics and now need to understand and apply software design to tasks like data analysis simulation signal processing or visualisation John Robinson introduces both software theory and its application to problem solving using a range of design principles applied to the creation of medium sized systems providing key methods and tools for designing reliable efficient maintainable programs The case studies are presented within scientific contexts to illustrate all aspects of the design process allowing students to relate theory to real world applications Core computing topics usually found in separate specialised texts presented to meet the specific requirements of science and engineering students Demonstrates good practice through applications case studies and worked examples based in real world contexts
