

Preface to *Distillation: Fundamentals and Principles*

This is the first book in a three-volume series covering all aspects of *Distillation*. This volume focuses on the fundamental principles of distillation with particular emphasis on practical understanding of design and operation. The chapters are written by different authors and the approach, depth, and extent of subject matter coverage may therefore differ from chapter to chapter, however, together they represent a comprehensive overview of the current state of the art.

The first chapter traces the historical development of distillation from the first applications over 5000 years ago, via the medieval period, and the nineteenth-century industrial developments, to contemporary applications with emphasis on the applications and equipment which led to our current technology. A prerequisite for the design of distillation columns is knowledge of vapor–liquid equilibrium (VLE) and of mass transfer phenomena. Chapter 2 considers thermodynamic models for the prediction of VLEs, and the conditions for the occurrence of azeotropes. In Chapter 3, an account is given of the fundamental principles of mass transfer including diffusion, mass transfer coefficients, and mass transfer of both binary and multicomponent mixtures in both tray and packed columns.

Chapter 4 sets out the fundamental principles of binary distillation including simple calculation and analysis methods. This is followed by an account of batch distillation in Chapter 5, giving an overview of the fundamentals of batch distillation, including different operating modes, alternative column configurations and more complex batch distillation processes. Chapter 6 considers energy-efficient distillation design and operation, including columns operating both above and below ambient temperatures. Various advanced and complex distillation column configurations are also introduced.

Chapters 7 and 8 consider design of distillation processes. Chapter 7 describes the conceptual design of zeotropic multicolumn distillation configurations. A computationally efficient mathematical framework is described that synthesizes configurations that use $n-1$ distillation columns for separating a zeotropic mixture into n product streams. Chapter 8 turns the attention to azeotropic systems and describes a systematic framework for their conceptual design, considering and comparing different approaches. Several shortcut methods are presented, followed by an account of rigorous optimization, and their applicability for design is discussed.

Aspects of design, analysis, and application of hybrid distillation schemes are covered in Chapter 9. These hybrid distillation schemes become necessary when separation tasks such as separation of azeotropic or close-boiling mixtures cannot
