Towards an Efficient Distributed Cloud Architecture Praveen Khethavath,2014 Cloud computing is an emerging field in computer science Users are utilizing less of their own existing resources while increasing usage of cloud resources There are many advantages of distributed computing over centralized architecture With increase in number of unused storage and computing resources and advantages of distributed computing resulted in distributed cloud computing In the distributed cloud environment that we propose resource providers RP compete to provide resources to the users In the distributed cloud all the cloud computing and storage services are offered by distributed resources In this architecture resources are used and provided by the users in a peer to peer fashion We propose using multi valued distributed hash tables for efficient resource discovery Leveraging the fact that there are many users providing resources such as CPU and memory we define these resources under one key to easily locate devices with equivalent resources We then propose a new auction mechanism using a reserve bid formulated rationally by each user for the optimal allocation of discovered resources We have evaluated the performance of resource discovery mechanisms for the distributed cloud and distributed cloud storage and compared the results with existing DHTs peer to peer clients such as VUZE and explored the feasibility and efficiency of the proposed schemes in terms of resource service discovery and allocation We use a simultaneous Auction mechanism and select a set of winners once we receive all contributions or bids In a real world scenario users request resources with multiple capabilities and in order to find such resources we use a contribution mechanism where service providers will provide a contribution price to users for providing a resource Users use our proposed auction mechanism to select the resources from the set of resource providers We show that Nash equilibrium can be achieved and how we can avoid the problem of free riders in the distributed cloud Network latency is an important factor when deciding which resource provider to select We used treeple a secure latency estimation scheme
