

LAB: LOOKING AT LENSES

Introduction:

A **lens** is a piece of glass or other transparent material with a curved surface that forms images by causing light rays to reflect. Lenses form two types of images. A **real image** is an image formed when light rays meet. Real images are formed when light rays come together or converge and are always upside down. A **virtual image** is an image formed due to the imaginary meeting of light rays. A virtual image is formed when light rays appear apart or diverge and are always upright. Since the brain interprets light rays as traveling in a straight line, a virtual image appears to come from a location in the lens that doesn't really exist.

There are two main types of lenses. A **convex lens** is thicker in the center than at the edges. A convex lens makes parallel light rays converge at a precise location called the **focal point**. This distance from the center of the lens to the focal point is known as the **focal length**. A **concave lens** is thinner in the center than at the edges. A concave lens causes parallel light rays diverge.

LAB

Looking at Lenses

1. Using a marker, draw a simple stick figure on an index card.
2. Find an empty section of a wall with at least 2 m of room between you and the wall. Tape the index card to the wall at eye level.
3. Standing 1 m away from the card, hold a convex lens at arm's length from your eye. Look at the stick figure through the lens. What do you observe about the image? Is it upright or inverted? Is it smaller or larger than the original drawing? Record these observations in the data table.
4. Now, walk closer to the wall and hold the lens so that it is only 2-3 cm away from the card. Look at the stick figure through the lens again. Record observations as in Step 3.
5. Move the lens back and forth from the wall until you find the position where the image appears to "flip". Move a partner measure how far the lens is from the card. This is the focal point of the lens. Record.

Procedure B: Making a Concave Lens

6. Sketch the convex lens for a concave lens.
7. Standing 1 m away from the card, hold the concave lens at arm's length and look at the index card through the lens. What do you observe about the image this time? Is it upright or inverted? Is it smaller or larger than the original drawing? Record these observations in the data table.
8. Now, walk closer to the card and position your lens so that it is only 2-3 cm away. Does the image change as it does with a convex lens?
