LIGHT ENERGY

Have you ever thought why the world around us is so colorful? Butterflies, flowers, green grasses and trees all around us. Do you know where all these colours come from? Why a rainbow has 7 colors? How does a mirror work? Actually! all of these happen because of different properties of light.

Light is a form of **energy**. It travels in waves called **Electromagnetic waves**. Light is the only electromagnetic wave we can see. There are others like X-rays, gamma rays and radio waves. We cannot see these other types. We can only see **Visible Light**. These waves have different wavelength which creates different colours. Why does a rainbow have 7 colors? Its because white light is made of 7 colours. When white sunlight hits water droplets in atmosphere, it splits into 7 colors.

Do you know how fast light can travel? In vacuum speed of light is 186000 miles per second. It means, light can travel 7 times around the Earth in 1 second. Speed of light is constant, means it never changes. Light does not need a medium to travel.

Some sources of light are Sun, bulb, LED, candles etc. Sun is the primary source of light on Earth. Most organisms depend on sunlight for their life. Plants need sunlight to make their food through a process called **photosynthesis**. And all the humans and animals depend on plants for their food. So we all need sunlight for our food.

Scientists have created solar panels to convert light energy into electricity. We study about light in a subject called **Physics**.

Light rays always travel in **straight line**. When light hits an object and bounces off, its called **Reflection**. We can see our image in a mirror because of Reflection. The Moon shines because it reflects sunlight. Sometimes light
