Computer Vision For Visual Effects:

Computer Vision for Visual Effects Richard J. Radke, 2012-11-19 Modern blockbuster movies seamlessly introduce impossible characters and action into real world settings using digital visual effects. These effects are made possible by research from the field of computer vision, the study of how to automatically understand images. Computer Vision for Visual Effects will educate students, engineers, and researchers about the fundamental computer vision principles and state of the art algorithms used to create cutting edge visual effects for movies and television. The author describes classical computer vision algorithms used on a regular basis in Hollywood such as blue screen matting, structure from motion, optical flow, and feature tracking, and exciting recent developments that form the basis for future effects such as natural image matting, multi-image compositing, image retargeting, and view synthesis. He also discusses the technologies behind motion capture and three-dimensional data acquisition. More than 200 original images demonstrating principles, algorithms, and results, along with in-depth interviews with Hollywood visual effects artists, tie the mathematical concepts to real world filmmaking. Computer Vision for Visual Effects Richard J. Radke, 2013 This book explores the fundamental computer vision principles and state of the art algorithms used to create cutting edge visual effects for movies and television. It describes classical computer vision algorithms and recent developments, features more than 200 original images, and contains in-depth interviews with Hollywood visual effects artists that tie the mathematical concepts to real world filmmaking.

Introduction to Visual Effects Bruno Madeira, Luiz Velho, 2022-12-06 Introduction to Visual Effects: A Computational Approach is the first single introduction to the computational and mathematical aspects of visual effects, incorporating both computer vision and graphics. The book also provides the readers with the source code to a library enabling them to follow the chapters directly and build up a complete visual effects platform. The book covers the basic approaches to camera pose estimation, global illumination, and image-based lighting, and includes chapters on the virtual camera optimization and computer vision path tracing, and many more. Key features include: Introduction to projective geometry, image-based lighting, IBL, global illumination solved by the Monte Carlo method, Pathtracing, an explanation of a set of optimization methods and the techniques used for calibrating one, two, and many cameras, including how to use the RANSAC algorithm in order to make the process robust, and providing code to be implemented using the Gnu Scientific Library, C++ code using the OpenCV library to be used in the process of tracking points on a movie, an important step for the matchmove process, and in the construction of modeling tools for visual effects. A simple model of the Bidirectional Reflectance Distribution Function (BRDF) of surfaces and the differential rendering method, allowing the reader to generate consistent shadows supported by a code that can be used in combination with a software like Luminaire HDR.

Combating Bad Weather Part II Sudipta Mukhopadhyay, Abhishek Kumar Tripathi, 2022-05-31 Every year lives and properties are lost in road accidents About one fourth of these accidents are due to low vision in foggy weather At present there is no algorithm that is specifically designed for the removal of fog from videos Application of a single image fog removal algorithm over each video frame is a time consuming and costly affair It is demonstrated that with the intelligent use of temporal redundancy fog removal algorithms designed for a single image can be extended to the real time video application Results confirm that the presented framework used for the extension of the fog removal algorithms for images to videos can reduce the complexity to a great extent with no loss of perceptual quality This paves the way for the real life application of the video fog removal algorithm In order to remove fog an efficient fog removal algorithm using anisotropic diffusion is developed The presented fog removal algorithm uses new dark channel assumption and anisotropic diffusion for the initialization and refinement of the airlight map respectively Use of anisotropic diffusion helps to estimate the better airlight map estimation The said fog removal algorithm requires a single image captured by uncalibrated camera system The anisotropic diffusion based fog removal algorithm can be applied in both RGB and HSI color space This book shows that the use of HSI color space reduces the complexity further The said fog removal algorithm requires pre and post processing steps for the better restoration of the foggy image These pre and post processing steps have either data driven or constant parameters that avoid the user intervention Presented fog removal algorithm is independent of the intensity of the fog thus even in the case of the heavy fog presented algorithm performs well Qualitative and quantitative results confirm that the presented fog removal algorithm outperformed previous algorithms in terms of perceptual quality color fidelity and execution time The work presented in this book can find wide application in entertainment industries transportation tracking and consumer electronics
