Concepts Of Force Max Jammer:

Concepts of Force Max Jammer, 1957 Both historical treatment and critical analysis this work by a noted physicist traces conceptual development from ancient to modern times Kepler's initiation Newton's definition subsequent reinterpretation contrasting concepts of Leibniz Boscovich Kant with those of Mach Kirchhoff Hertz An excellent presentation Science 1962 ed **Concepts of Force, a Study in Foundations of Dynamics**, 1957 **Ruggiero**

Boscovich's Theory of Natural Philosophy Luca Guzzardi, 2020-08-31 Drawing on published works correspondence and manuscripts this book offers the most comprehensive reconstruction of Boscovich's theory within its historical context It explains the genesis and theoretical as well as epistemological underpinnings in light of the Jesuit tradition to which Boscovich belonged and contrasts his ideas with those of Newton Leibniz and their legacy Finally it debates crucial issues in early modern physical science such as the concept of force the particle like structure of matter the idea of material points and the notion of continuity and shares novel insights on Boscovich's alleged influence on later developments in physics With its attempt to reduce all natural forces to one single law Boscovich's Theory of Natural Philosophy published in 1758 left a lasting impression on scientists and philosophers of every age regarding the fundamental unity of physical phenomena The theory argues that every pair of material points is subject to one mutual force and always the same force which is their propensity to be mutually attracted or repelled depending on their distance from one another Furthermore the action of this unique force is visualized through a famous diagram that fascinated generations of scientists But his understanding of key terms of the theory such as the notion of force involved and the very idea of a material point is only ostensibly similar to our current conceptual framework Indeed it needs to be clarified within the plurality of contexts in which it has emerged rather than being considered in view of later developments The book is recommended for scholars and students interested in the ideas of the early modern period especially historians and philosophers of science mathematicians and physicists with an interest in the history of the discipline and experts on Jesuit science and philosophy *The Universal Force* Louis Girifalco, 2008 This book describes the growth of our understanding of gravity and the science on which it is based from the early Greeks to Einstein's grand insights of curved space time Showing that science searches for the ultimate roots of natural phenomena and therefore pursues a kind of mysticism the mysteries it unfolds are strange and enthralling **Force from Nietzsche to Derrida** Clare Connors, 2017-12-02 What is the pervasive character of the world The answer is force But as Heidegger asks next What is force Connors sets out to answer this question tracing a genealogy of the idea of force through the writings of Nietzsche Heidegger Foucault and Derrida These thinkers try to pin down what force is but know too that it is something which cannot be neutrally described Their vigorously literary writings must therefore be read as much for the stylistic and rhetorical ways in which they render force's powerful elusiveness as for the content of their arguments And it is perhaps literature rather than philosophy which best engages with force Certainly for Connors these philosophical positions

are foreshadowed in remarkable detail by Shakespeare's Henry V a play shot through with forces imaginary military rhetorical and bodily

The Concept of Nature Alfred North Whitehead, 2013-01-23 The brilliant mathematician explores the problems of substance space and time criticizes Einstein's method of interpreting results and offers an alternative theory of the four dimensional space time manifold 1920 edition

Building Time David Leatherbarrow, 2020-11-26 While most books on architecture concentrate on spatial themes this book explores architecture's temporal dimensions Through a series of close readings of buildings both contemporary and classic it demonstrates the centrality of time in modern architecture and shows why an understanding of time is critical to understanding good architecture All buildings exist in time Even if designed for permanence they change slowly but inevitably They change use they accrue history and meaning they decay all of these processes are inscribed in time So too is the path traced by the sun through a building and the movements of the human body from room to room Time this book argues is the framework for our spatial experience of architecture and a key dimension of a building's structure and significance Building Time presents twelve close readings of buildings and artworks which explore this idea Examining works by distinctive modern architects from Eileen Gray to Ivar Siza and Wang Shu it takes the reader in some cases literally step by step through a built work and provides insightful reflections on the importance of making space for time in architectural design This is a book for both theorists and for architectural designers Through it theorists will find a way to rethink the fundamental premises and aims of design work while designers will rediscover the order and ideas that shape the world around them its buildings interiors and landscapes

Science and Nature Carolyn Merchant, 2017-11-07 Science and Nature brings together the work and insights of historian Carolyn Merchant on the history of science environmental history and ethics The book explores her ideas about the interconnections among science women nature and history as they have emerged over her academic lifetime Focusing on topics such as The Death of Nature the Scientific Revolution women in the history of science and environment and partnership ethics it synthesizes her writings and sets out a vision for the twenty first century Anyone interested in the interactions between science and nature in the past present and future will want to read this book It is an ideal text for courses on the environment environmental history history of science and the philosophy of science

Action and Reaction Paul Theerman, Adele F. Seeff, 1993-04 The volume opens with an essay by Richard S Westfall that justifies claims that Newton was the culmination of the scientific revolution The I Bernard Cohen essay that follows illustrates the difference between mathematical principles and natural philosophy Two complementary papers give new insights into the Newtonian foundations of celestial mechanics William Harper analyzes Newton's argument for universal gravitation from the perspective of a philosopher of science Michael S Mahoney discusses the mathematical aspects of Newton's use of force law to determine planetary orbits

Metaphors and Action Schemes Robert L. Schwarz, 1997 All our abstract ideas are based on metaphors and action schemes Jean Piaget did voluminous research on how thought develops in children through

assimilation of action schemes George Lakoff and Mark Johnson have done pioneering work on metaphors and action schemes in everyday thinking This book builds on those foundations looking at the role played by metaphors and action schemes in the history of ideas The author begins his argument by taking a critical look at the philosophy of metaphor from Aristotle to the present While he sees metaphor as simply conceiving one thing in terms of another he points out that this is an inexhaustible process because the context in which the process takes place is always changing Change opens up new possibilities of similarity Thus the metaphor is an open door into a space of infinite possibilities Proceedings of the 1972 Biennial Meeting of the Philosophy of Science Association K. Material Inhomogeneities in Elasticity G.A. Maugin, 2020-09-10 Self contained this book presents a thorough introduction to the complementary notions of physical forces and material or configurational forces All the required elements of continuum mechanics deformation theory and differential geometry are also covered This book will be a great help to many whilst revealing to others a rather new facet of continuum mechanics in general and elasticity in particular An organized exposition of continuum mechanics on the material manifold is given which allows for the consideration of material inhomogeneities in their most appropriate framework In such a frame the nonlinear elasticity of anisotropic inhomogeneous materials appears to be a true field theory Extensions to the cases of electroelasticity and magnetelasticity are then straightforward In addition this original approach provides systematic computational means for the evaluation of characteristic parameters which are useful in various branches of applied mechanics and mathematical physics This is the case for path independent integrals and energy release rates in brittle fracture the influence of electromagnetic fields on fracture criteria such as in ceramics the notion of momentum of electromagnetic fields in matter in optics and the perturbation of solitons propagating in elastic dispersive systems

Feuerbach Marx W. Wartofsky, 1982-08-31 Feuerbach is now recognized as a central figure in the history of nineteenth century thought He was one of Hegel's most influential pupils he dominated German radical philosophy in the 1840s and was the leader of the Young Hegelians his anthropological critique of Hegel's idealism decisively influences the materialism and humanism of Marx and Engels his critique of religion pointed the way for the philosophers of religion and his psychological analyses found a place in Freudian thought and the existential and phenomenological traditions In this 1977 text Professor Wartofsky wishes to go beyond this conventional view to establish Feuerbach as much more than a transitional figure between Hegel and Marx or an influence on important later developments He seriously considers Feuerbach's philosophy on its own terms and seeks to demonstrate its continuing importance He therefore traces Feuerbach's development in detail emphasizing its dialectical character and finds fundamental originality in his epistemology

The Reality of the Unobservable E. Agazzi, M. Pauri, 2013-04-17 Observability and Scientific Realism It is commonly thought that the birth of modern natural science was made possible by an intellectual shift from a mainly abstract and speculative conception of the world to a carefully elaborated image based on observations There is some grain of truth in this claim but this grain depends very much on what one takes observation to be In the philosophy of science of our century observation has been practically equated with sense perception This is understandable if we think of the attitude of radical empiricism

that inspired Ernst Mach and the philosophers of the Vienna Circle who powerfully influenced our century's philosophy of science. However, this was not the attitude of the founders of modern science. Galileo, for example, expressed in a famous passage of the *Assayer* the conviction that perceptual features of the world are merely subjective and are produced in the *anima* by the motion and impacts of unobservable particles that are endowed uniquely with mathematically expressible properties and which are therefore the real features of the world. Moreover, on other occasions when defending the Copernican theory, he explicitly remarked that in admitting that the Sun is static and the Earth turns on its own axis, reason must do violence to the sense and that it is thanks to this violence that one can know the true constitution of the universe.

Barth and Ecotheology Adrian Langdon, 2025-03-31 *Barth and Ecotheology* offers a critical and constructive reading of Karl Barth's theology in the context of the Anthropocene. It reflects on how a contemporary doctrine of creation must be broad enough to address issues such as climate change, colonialism, and racism, sexism, as well as integrating modern science. Such a theology would resist the human domination of nature and the various forms of displacement occurring in modernity. With Barth, the author contends that a theology of creation grounded in the self-revelation of God in Jesus Christ is the best place to rethink what it means to be human and to exist within the community of creation. Nevertheless, if we are to affirm the livingness of the world, creaturely differences, and a central place for land and place, then critical additions to Barth are needed. To accomplish this, the book provides constructive reinterpretations of Barth's theological method, doctrine of God, creation by the Word and Spirit, anthropology, and reconciliation. What emerges is a vision of the triune God of love as the source and ground of all that is. Along the way, Barth is brought into dialogue with ecotheology as well as theologians such as Wolfhart Pannenberg, Dietrich Bonhoeffer, and Bruce McCormack. The volume will be of particular interest to theologians focused on the doctrine of creation, ecotheology, and Barth studies.

Life and Evolution Lorenzo Baravalle, Luciana Zaterka, 2020-04-10 This book offers to the international reader a collection of original articles of some of the most skillful historians and philosophers of biology currently working in Latin American universities. During the last decades, increasing attention has been paid in Latin America to the history and philosophy of biology, but since many local authors prefer to write in Spanish or in Portuguese, their ideas have barely crossed the boundaries of the continent. This volume aims to remedy this state of things, providing a good sample of this production to the English-speaking readers, bringing together contributions from researchers working in Brazilian, Argentinean, Chilean, Colombian, and Mexican universities. The stress on the regional provenance of the authors is not intended to suggest the existence of something like a Latin American history and philosophy of biology, supposedly endowed with distinctive features. On the contrary, the editors firmly believe that advances in this field can be achieved only by stimulating the integration in the international debate. Based on this assumption, the book focuses on two topics: life and evolution, and presents a selection of contributions addressing issues such as the history of the concept of life, the philosophical reflection on life, manipulation, and life extension, the structure and development of evolutionary theory.

as well as human evolution Life and Evolution Latin American Essays on the History and Philosophy of Biology will provide the international reader with a rather complete picture of the ongoing research in the history and philosophy of biology in Latin America offering a snapshot of this dynamic community It will also contribute to contextualize and develop the debate concerning life and evolution and the relation between the two phenomena **Herder's Aesthetics and the European Enlightenment** Robert Edward Norton,1991 **An Introduction to the History of Structural Mechanics** Edoardo Benvenuto,2012-12-06 This book is one of the finest I have ever read To write a foreword for it is an honor difficult to accept Everyone knows that architects and master masons long before there were mathematical theories erected structures of astonishing originality strength and beauty Many of these still stand Were it not for our now acid atmosphere we could expect them to stand for centuries more We admire early architects visible success in the distribution and balance of thrusts and we presume that master masons had rules perhaps held secret that enabled them to turn architects bold designs into reality Everyone knows that rational theories of strength and elasticity created centuries later were influenced by the wondrous buildings that men of the sixteenth seventeenth and eighteenth centuries saw daily Theorists know that when at last theories began to appear architects distrusted them partly because they often disregarded details of importance in actual construction partly because nobody but a mathematician could understand the aim and function of a mathematical theory designed to represent an aspect of nature This book is the first to show how statics strength of materials and elasticity grew alongside existing architecture with its millennial traditions its host of successes its ever renewing styles and its numerous problems of maintenance and repair In connection with studies toward repair of the dome of St Peter s by Poleni in 1743 on p
