Simulation and Modelling of Organic Thermoelectric Materials and Devices

Najmeh Zahabi, 2025-05-06 As the need for autonomous and on site renewable power sources grows developing efficient energy solutions for distributed sensors wearable electronics cooling systems and other low power applications has become increasingly critical Organic thermoelectric generators TEGs which convert low grade heat into electrical energy through the Seebeck effect offer a promising solution for powering these devices Organic TEGs possess some advantages over inorganic TEGs in the context of sustainable energy harvesting because the active materials are often solution processable at room temperature which enables scalable patterning and printing techniques Furthermore these semiconductors are typically derived from Earth abundant non toxic elements making them environmentally friendly and sustainable Among organic semiconductors conducting polymers particularly PEDOT Poly 3 4 ethylenedioxythiophene emerge as pivotal materials in organic TEGs due to their favorable electrical and thermal properties Thus a deep understanding of these polymers is essential for guiding material design and optimizing device performance In this regard computational methods represent an important tool in studies of organic thermoelectric materials and devices since they not only provide insights into the electronic and thermal properties of materials on atomic and molecular levels but also allow for the prediction of the device s performance without the need for extensive experimental work This thesis employs multi scale computational modeling to advance the understanding and optimization of organic thermoelectric materials and devices including I Finite element method modeling to analyze and optimize the micro TEGs II Ab initio molecular dynamics simulations to investigate charge transport mechanisms in PEDOT conducting polymer and III Machine learning approaches to predict and study the electronic properties of PEDOT thin films Part I presents that achieving power densities in the range of mW cm^{-2} at a temperature gradient of 10 K is feasible through geometrical optimization and utilizing advanced organic thermoelectric inks Particularly we simulated the PEDOT PSS BBL PEI micro TEGs and improved device efficiency under varying thermal gradients using COMSOL software In part II we developed a computational technique based on ab initio molecular dynamics to trace the temporal motion of charge carriers in a single PEDOT chain and in coupled chains with varying degrees of interaction Subsequently we used ab initio molecular dynamics to demonstrate that charge transport along the chains is band like while transport across chains follows a hopping like mechanism The calculated polaron mobility

along the chains reached 4 cm²V¹s¹ providing a theoretical upper limit for thiophene based conducting polymers Also we quantified the hopping rate between chains consistent with Marcus theory by analyzing polaron jumps Part III integrates computational modeling with machine learning to explore changes in morphological and transport properties of PEDOT Tos prepared using different solvents We employed convolutional neural networks to achieve high accuracy r² 0.99 in predicting electronic coupling values and significantly accelerated the analysis compared to density functional theory calculations This approach enabled detailed investigations into how different solvents affect the electronic coupling of PEDOT dimers We believe that our findings on organic thermoelectric material and devices provide a comprehensive framework for improving the performance and scalability of organic TEGs and open new avenues for further research

Polímero Conductor. Fouad Sabry, 2022-01-26. ¿Qué es el polímero conductor? Los polímeros conductores o más precisamente los polímeros intrínsecamente conductores (ICP) son polímeros orgánicos que conducen la electricidad. Dichos compuestos pueden tener conductividad metálica o pueden ser semiconductores. La mayor ventaja de los polímeros conductores es su procesabilidad, principalmente por dispersión. Los polímeros conductores generalmente no son termoplásticos, es decir, no son termoformables. Pero como los polímeros aislantes, son materiales orgánicos. Pueden ofrecer una alta conductividad eléctrica, pero no muestran propiedades mecánicas similares a las de otros polímeros disponibles comercialmente. Las propiedades eléctricas se pueden ajustar utilizando métodos de síntesis orgánica y técnicas de dispersión avanzadas. Cómo beneficiarse. I. Insights y validaciones sobre los siguientes temas: Capítulo 1. Polímero conductor. Capítulo 2. Electrónica orgánica. Capítulo 3. Semiconductor orgánico. Capítulo 4. Electrónica molecular. Capítulo 5. Polímero microporoso conjugado. Capítulo 6. Ciencia de los materiales. Capítulo 7. Ciencia de los materiales en la ciencia ficción. II. Responder a las principales preguntas del público sobre polímeros conductores. III. Ejemplos del mundo real para el uso de polímeros conductores en muchos campos. IV. 17 apéndices para explicar brevemente 266 tecnologías emergentes en cada industria para tener una comprensión completa de 360 grados de las tecnologías de polímeros conductores. Para quién es este libro: Profesionales, estudiantes de pregrado y posgrado, entusiastas, aficionados y aquellos que quieran ir más allá del conocimiento o la información básica para cualquier tipo de polímero conductor.
