Response Modeling Jean-Paul Fox, 2010-05-19 The modeling of item response data is governed by item response theory also referred to as modern test theory The field of inquiry of item response theory has become very large and shows the enormous progress that has been made The mainstream literature is focused on frequentist statistical methods for estimating model parameters and evaluating model fit However the Bayesian methodology has shown great potential particularly for making further improvements in the statistical modeling process The Bayesian approach has two important features that make it attractive for modeling item response data First it enables the possibility of incorporating nondata information beyond the observed responses into the analysis The Bayesian methodology is also very clear about how additional information can be used Second the Bayesian approach comes with powerful simulation based estimation methods These methods make it possible to handle all kinds of priors and data generating models One of my motives for writing this book is to give an introduction to the Bayesian methodology for modeling and analyzing item response data A Bayesian counterpart is presented to the many popular item response theory books e.g. Baker and Kim 2004 De Boeck and Wilson 2004 Hambleton and Swaminathan 1985 van der Linden and Hambleton 1997 that are mainly or completely focused on frequentist methods The usefulness of the Bayesian methodology is illustrated by discussing and applying a range of Bayesian item response
