Digital Electronics And Laboratory Computer Experiments:

Digital Electronics and Laboratory Computer Experiments, 1975 Digital Electronics and Laboratory Computer Experiments Charles Wilkins, 2012-12-06 Science undergraduates have come to accept the use of computers as commonplace. The daily use of portable sophisticated electronic calculators, some of them rivaling general purpose minicomputers in their capabilities, has hastened this development. Over the past several years, computer assisted experimentation has assumed an important role in the experimental laboratory. Mini and microcomputer systems have become an important part of the physical scientist's array of analytical instruments. Prompted by our belief that this was an inevitable development, we began several years ago to develop the curricular materials presented in this manual. At the outset, several objectives seemed important to us. First, insofar as possible, the experiments included should be thoroughly tested and error free. Second, they should be compatible with a variety of laboratory computer data acquisition and control systems. Third, little or no previous background in either electronics or programming should be necessary. Of course, such background would be advantageous. To satisfy these objectives, we decided to adopt a widespread high level computer language, BASIC, suitably modified for the purpose. Furthermore, we have purposely avoided specifying any particular system or equipment. Rather, the functional characteristics of both hardware and software required are stipulated. The experiments have been developed using Varian 620 and Hewlett Packard 2100 series computers, but we believe they are readily transferable to other commonly available computer systems with a minimum of difficulty.

Automatic Methods of Analysis M. Valcárcel, M.D. Luque de Castro, 1988-08-01 This new monograph provides a comprehensive overview of the state of the art of the automation of laboratory processes in analytical chemistry. The topics have been chosen according to such criteria as the degree of consolidation, scope of application, and most promising trends. The first part of the book begins with the basic principles behind the automation of laboratory processes, then describes automatic systems for sampling and sample treatment. In the second part, the principal types of analysers are discussed: continuous batch and robotic. The third part is devoted to the automation of analytical instrumentation: spectroscopic, electroanalytical, and chromatographic techniques and titrators. The last part presents some examples of the application of automation to clinical chemistry, environmental pollution monitoring, and industrial process control. The text is supplemented by 290 figures and 800 literature references. It is written primarily for scientists directly involved in laboratory work and those responsible for industrial planning and control, research centres, etc. It will also be of interest to analytical chemists wishing to update their knowledge in this area and will be of especial interest to scientists directly related to environmental sciences or clinical chemistry.

A Guide to Undergraduate Science Course and Laboratory Improvements National Science Foundation (U.S.). Directorate for Science Education, 1979 Computers in Analytical Chemistry R. influencing the techniques of observing chemical systems the acquisition of data its storage and its transmission from one location to another Many important concepts such as interfacing data collection data bases information services and computer networks are covered in an easily assimilated and comprehensive way **American Journal of Physics** ,1991
