Digital Control Systems Design Identification And Implementation Communications And Control Engineering:

Digital Control Systems Ioan Doré Landau, Gianluca Zito, 2005-10-13 The extraordinary development of digital computers microprocessors microcontrollers and their extensive use in control systems in all fields of applications has brought about important changes in the design of control systems Their performance and their low cost make them suitable for use in control systems of various kinds which demand far better capabilities and performances than those provided by analog controllers However in order really to take advantage of the capabilities of microprocessors it is not enough to reproduce the behavior of analog PID controllers One needs to implement specific and high performance model based control techniques developed for computer controlled systems techniques that have been extensively tested in practice In this context identification of a plant dynamic model from data is a fundamental step in the design of the control system The book takes into account the fact that the association of books with software and on line material is radically changing the teaching methods of the control discipline Despite its interactive character computer aided control design software requires the understanding of a number of concepts in order to be used efficiently The use of software for illustrating the various concepts and algorithms helps understanding and rapidly gives a feeling of the various phenomena *Model Predictive Vibration Control* Gergely Takács, Boris Rohal-Ilkiv, 2012-03-05 Real time model predictive controller MPC implementation in active vibration control AVC is often rendered difficult by fast sampling speeds and extensive actuator deformation asymmetry If the control of lightly damped mechanical structures is assumed the region of attraction containing the set of allowable initial conditions requires a large prediction horizon making the already computationally demanding on line process even more complex Model Predictive Vibration Control provides insight into the predictive control of lightly damped vibrating structures by exploring computationally efficient algorithms which are capable of low frequency vibration control with guaranteed stability and constraint feasibility In addition to a theoretical primer on active vibration damping and model predictive control Model Predictive Vibration Control provides a guide through the necessary steps in understanding the founding ideas of predictive control applied in AVC such as the implementation of computationally efficient algorithms control strategies in simulation and experiment and typical hardware requirements for piezoceramics actuated smart structures The use of a simple laboratory model and inclusion of over 170 illustrations provides readers with clear and methodical explanations making Model Predictive Vibration Control the ideal support material for graduates researchers and industrial practitioners with an interest in efficient predictive control to be utilized in active vibration attenuation Computer Aided Design in Control Systems 1988 Zhen-Yu Chen, 2017-05-03 This volume contains 73 papers presenting the state of the art in computer aided design in control systems CADCS The latest information and exchange of ideas presented at the Symposium illustrates the development of computer aided design science and technology within control systems The Proceedings contain six plenary papers and six special invited papers and the remainder are divided into five themes CADCS packages CADCS

software and hardware systems design methods CADCS expert systems CADCS applications with finally a discussion on CADCS in education and research **Interactive Collaborative Robotics** Andrey Ronzhin,Aminagha Sadigov,Roman Meshcheryakov,2023-09-04 This book constitutes the refereed proceedings of the 8th International Conference on Interactive Collaborative Robotics ICR 2023 held in Baku Azerbaijan during October 25 29 2023 The 33 full papers included in this book were carefully reviewed and selected from 56 submissions They were organized in topical sections as follows focused the foundations and means of collaborative behavior of one or more robots physically interacting with hu mans in operational environments configured with embedded sensor networks and cloud services under uncertainty and environmental variability
