Ontologically Controlled Autonomous Systems: Principles, Operations, and Architecture

George A. Fodor, 2013-11-27 Kevin M Passino When confronted with a control problem for complicated physical process a control engineer usually follows a predetermined design procedure This procedure often begins with the engineer seeking to

understand the process and the primary control objectives A simple example of a control problem is an automobile cruise

control that provides the automobile with the capability of regulating its own speed at a driver specified set point e g 55 mph

One solution to the automotive cruise control problem involves adding an electronic controller that can sense the speed of the vehicle via the speedometer and actuate the throttle position so as to regulate the vehicle speed at the driver specified

value Such speed regulation must be accurate even if there are road grade changes head winds or variations in the number of passengers in the automobile After gaining an intuitive understanding of the plant's dynamics and establishing the design

objectives the control engineer typically solves the cruise control problem by using an established design procedure In

particular this control engineering design methodology involves 1 Modeling understanding the plant 2 Construction of a

controller to meet specifications such as stability rise time overshoot and steady state error 3 Analysis to make sure that the system will meet the performance objectives e g we might use mathematical simulation based or experimental analysis and 4

Iterating on the design until it is possible to commission the control system
