Ashenden, 2007-10-24 Digital Design An Embedded Systems Approach Using VHDL provides a foundation in digital design for students in computer engineering electrical engineering and computer science courses It takes an up to date and modern approach of presenting digital logic design as an activity in a larger systems design context Rather than focus on aspects of digital design that have little relevance in a realistic design context this book concentrates on modern and evolving knowledge and design skills

Hardware description language HDL based design and verification is emphasized VHDL examples are used extensively throughout By treating digital logic as part of embedded systems design this book provides an understanding of the hardware needed in the analysis and design of systems comprising both hardware and software components Includes a Web site with links to vendor tools labs and tutorials Presents digital logic design as an activity in a larger systems design context Features extensive use of VHDL examples to demonstrate HDL hardware description language usage at the abstract behavioural level and register transfer level as well as for low level verification and verification environments Includes worked examples throughout to enhance the reader s understanding and retention of the material Companion Web site includes links to tools for FPGA design from Synplicity Mentor Graphics and Xilinx VHDL source code for all the examples in the book lecture slides laboratory projects and solutions to exercises

New Solutions for an Old Challenge Ronny Merkel,2014 In criminal investigations latent fingerprints are often considered as reliable means of identifying suspects However the evidential value of a print is strongly dependent on the knowledge of its age the time which has passed since deposition Suspects might admit their previous presence at a crime scene but often claim to have been there prior to or after the crime Especially in regard to public or highly frequented crime scenes prints might lose their evidential value in this case potentially leading to dropped charges Despite its high relevance the challenge of estimating a latent print s age could not be adequately addressed for 80 years In this thesis non invasive high resolution capturing devices are for the first time applied to the age estimation challenge replacing classical physical or chemical print development techniques They allow to capture a single print in regular time intervals and to systematically study its degradation behavior Introducing automated processing methods in the form of a digital pipeline including preprocessing feature extraction and age estimation techniques objective age estimates are presented for the first time in this field Maximum classification performances of different capturing devices between 76% and 86% are achieved for two class problems Furthermore a qualitative influence model on the aging speed of latent prints is designed forming a prerequisite for future studies
