1(a). The differential equation can be rewritten as

$$\frac{dy}{5-y} = dt.$$

Integrating both sides of this equation results in  $-\ln|5-y| = t + c_1$ , or equivalently,  $5-y = c e^{-t}$ . Applying the initial condition  $y(0) = y_0$  results in the specification of the constant as  $c = 5 - y_0$ . Hence the solution is  $y(t) = 5 + (y_0 - 5)e^{-t}$ .

All solutions appear to converge to the equilibrium solution  $y(t) = 5$ .

1(c). Rewrite the differential equation as

$$\frac{dy}{10-2y} = dt.$$

Integrating both sides of this equation results in  $-\frac{1}{2}\ln|10-2y| = t + c_1$ , or equivalently,  $5-y = c e^{-2t}$ . Applying the initial condition  $y(0) = y_0$  results in the specification of the constant as  $c = 5 - y_0$ . Hence the solution is  $y(t) = 5 + (y_0 - 5)e^{-2t}$ .

All solutions appear to converge to the equilibrium solution  $y(t) = 5$ , but at a *faster* rate than in Problem 1a.

2(a). The differential equation can be rewritten as

**Elementary Differential Equations and Boundary Value Problems** William E. Boyce, Richard C. DiPrima, Douglas B. Meade, 2017-08-21 Elementary Differential Equations and Boundary Value Problems 11e like its predecessors is written from the viewpoint of the applied mathematician whose interest in differential equations may sometimes be quite theoretical sometimes intensely practical and often somewhere in between The authors have sought to combine a sound and accurate but not abstract exposition of the elementary theory of differential equations with considerable material on methods of solution analysis and approximation that have proved useful in a wide variety of applications While the general structure of the book remains unchanged some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications In addition to expanded explanations the 11th edition includes new problems updated figures and examples to help motivate students The program is primarily intended for undergraduate students of mathematics science or engineering who typically take a course on differential equations during their first or second year of study The main prerequisite for engaging with the program is a working knowledge of calculus gained from a normal two or three semester course sequence or its equivalent Some familiarity with matrices will also be helpful in the chapters on systems of differential equations

**Linear Algebra and Differential Equations** Alexander Givental, 2001 The material presented in this book corresponds to a semester long course Linear Algebra and Differential Equations taught to sophomore students at UC Berkeley In contrast with typical undergraduate texts the book offers a unifying point of view on the subject namely that linear algebra solves several clearly posed classification problems about such geometric objects as quadratic forms and linear transformations This attractive viewpoint on the classical theory agrees well with modern tendencies in advanced mathematics and is shared by many research mathematicians However the idea of classification seldom finds its way to basic programs in mathematics and is usually unfamiliar to undergraduates To meet the challenge the book first guides the reader through the entire agenda of linear algebra in the elementary environment of two dimensional geometry and prior to spelling out the general idea and employing it in higher dimensions shows how it works in applications such as linear ODE systems or stability of equilibria Appropriate as a text for regular junior and honors sophomore level college classes the book is accessible to high school students familiar with basic calculus and can also be useful to engineering graduate students

**Differential Equations** Steven G.
