Third Generation Mobile Telecommunication Systems Peter Stavroulakis, 2012-12-06 One hundred years ago the notion of transmitting information without the use of wires must have seemed like magic In 1896 the first patent for wireless communication was granted to Marchese Guglielmo Marconi Since then the field of wireless communications which includes cellular systems has taken various forms of development It basically evolved through three Eras The Pioneer Era over the

period of 1860 1921 the Precellular Era over 1921 1980 and the Cellular Era after 1980 and beyond The first generation cellular era started with the Analog Systems and evolved in the digital domain utilizing Time Division Multiple Access TDMA and Code Division Multiple Access CDMA thus comprising the Second Generation Mobile Systems The first generation RF cellular communications systems deployed in the early to mid 1980 s had air interfaces comprised of analog technology Among them were AMPS Advanced Mobile Phone System NMT Nordic Mobile Telephone and TACS Total Access Communications System These were designed for use in a specific geographic area and not intended to be deployed in other areas There was not much commonality beyond using the same air interface technology and same modulation The air interface technology was Frequency Division Multiple Access FDMA and the modulation was analog FM but with different deviations and channel spacings The frequency bands air interface protocols number of channels and data rates were different In general these systems provided local and national coverage

Implementing Full Duplexing for 5G David B. Cruickshank, 2020-05-31 This exciting new book examines the feasibility of using a method of doubling the capacity of cellular networks by simultaneously transmitting and receiving signals at the same frequency a process known as full duplexing FD To realize full duplexing changes in the hardware of the cell base stations relaying equipment hot spot access points and mobile phones are necessary to prevent the hardware s transmitters from interfering with their own receivers This requires looking at how to separate the strong transmitted signal from the very weak received signal a process requiring both hardware analog changes and more complex digital signal processing Different ways of achieving that goal are examined The books reviews the merits of hardware changes involving new duplexing components that may be different depending on the frequency band and cell hardware being used Developing full duplex FD systems in 5G LTE cellular communications and what can be achieved with ferrite based circulators in terms of size reduction and performance enhancement especially at millimetric frequencies is considered The relative merits of ferrite and non ferrite circulators are compared in terms of their fundamental materials and device technologies such as isolation insertion loss bandwidth and non linearity FD in the entire 5G cell is also examined and its resulting range of equipment and device communication This includes front hauling more sophisticated back and front hauling backhaul beam switching and cell extenders and relays all of which could involve FD
