Wiertelarz, 2016-01-01 Computational methods in design practice are powerful tools for solving highly constrained problems and for refining existing design solutions Algorithmic tools can help in the design process and significantly extend the range of possible solutions The automation of many routines and the repetitive activities of the design process both provide a release for an architect allowing him or her more time to think about the design The main goal of this research study is to explore the potential of parametric modeling for dynamically resolving and controlling the particular conditions of the design and manufacturing processes. The vision is to be able to approach this process in general by way of several design systems for the construction of architectural models and finally to build up life sized solutions Virtual Futures for Design,

The line based two dimensional drawings on which conventional construction is based render this all but impossible This is the source of some major shortcomings in the construction industry and this book focuses on the two most fundamental of these the failure to deliver projects predictably to the required quality on time and within budget and the failure of most firms in the industry to make a survivable level of profit By transforming the quality of information used in building BIM aims to transform construction completely After describing and explaining these problems the way in which BIM promises to provide solutions is examined in detail A discussion of the theory and practice of BIM is also provided followed by a review of various recent surveys of BIM usage in the US UK and selected European economies The way in which other industries including retail and manufacturing have been transformed by information are explored and compared with current developments in the deployment of BIM in construction Five case studies from the UK show how BIM is being implemented and the effects it is having on architects and contractors This book is perfect for any construction professional interested in improving the efficiency of their business as well as undergraduate and postgraduate students wishing to understand the importance of BIM Harvard Design Magazine ,2005 Gearing Up and Accelerating Cross-fertilization between Academic and Industrial Robotics Research in Europe: Florian Röhrbein, Germano Veiga, Ciro Natale, 2013-11-23 This monograph by Florian R hrbein Germano Veiga and Ciro Natale is an edited collection of 15 authoritative contributions in the area of robot technology transfer between academia and industry It comprises three parts on Future Industrial Robotics Robotic Grasping as well as Human Centered Robots The book chapters cover almost all the topics nowadays considered hot within the robotics community from reliable object recognition to dexterous grasping from speech recognition to intuitive robot programming from mobile robot navigation to aerial robotics from safe physical human robot interaction to body extenders All contributions stem from the results of ECHORD the European Clearing House for Open Robotics Development a large scale integrating project funded by the European Commission within the 7th Framework Programme from 2009 to 2013

ECHORD s two main pillars were the so called experiments 51 small sized industry driven research projects and the structured dialog a powerful interaction instrument between the stakeholders The results described in this volume are expected to shed new light on innovation and technology transfer from academia to industry in the field of robotics
