Digital Integrated Circuits 2nd Edition:

Digital Integrated Circuits John E. Ayers, 2018-09-03 Exponential improvement in functionality and performance of digital integrated circuits has revolutionized the way we live and work. The continued scaling down of MOS transistors has broadened the scope of use for circuit technology to the point that texts on the topic are generally lacking after a few years. The second edition of *Digital Integrated Circuits Analysis and Design* focuses on timeless principles with a modern interdisciplinary view that will serve integrated circuits engineers from all disciplines for years to come. Providing a revised instructional reference for engineers involved with Very Large Scale Integrated Circuit design and fabrication, this book delves into the dramatic advances in the field, including new applications and changes in the physics of operation made possible by relentless miniaturization. This book was conceived in the versatile spirit of the field to bridge a void that had existed between books on transistor electronics and those covering VLSI design and fabrication as a separate topic. Like the first edition, this volume is a crucial link for integrated circuit engineers and those studying the field, supplying the cross-disciplinary connections they require for guidance in more advanced work. For pedagogical reasons, the author uses SPICE level 1 computer simulation models but introduces BSIM models that are indispensable for VLSI design. This enables users to develop a strong and intuitive sense of device and circuit design by drawing direct connections between the hand analysis and the SPICE models. With four new chapters, more than 200 new illustrations, numerous worked examples, case studies, and support provided on a dynamic website, this text significantly expands concepts presented in the first edition. *Digital Integrated Circuits* Jan M. Digital Integrated Circuits Evgeni Perelroyzen, 2018-10-03 A current trend in digital design, the integration of the MATLAB components Simulink and Stateflow for model building, simulations, system testing, and fault detection, allows for better control over the design flow process and ultimately for better system results. *Digital Integrated Circuits Design for Test Using Simulink and Stateflow* illustrates the construction of Simulink models for digital project test benches in certain design-for-test fields. The first two chapters of the book describe the major tools used for design-for-test. The author explains the process of Simulink model building, presents the main library blocks of Simulink, and examines the development of finite state machine modeling using Stateflow diagrams. Subsequent chapters provide examples of Simulink modeling and simulation for the latest design-for-test fields, including combinational and sequential circuits, controllability, and observability, deterministic algorithms, digital circuit dynamics, timing verification, built-in self-test (BIST), architecture scan, cell operations, and functional and diagnostic testing. The book also discusses the automatic test pattern generation (ATPG) process, the logical determinant theory, and joint test action group (JTAG) interface models. *Digital Integrated Circuits* explores the possibilities of MATLAB's tools in the development of application-specific integrated circuit (ASIC) design systems. The

book shows how to incorporate Simulink and Stateflow into the process of modern digital design Digital Integrated Circuits Jan M. Digital Integrated Circuits Jan M. Rabaey, 1996 Beginning with discussions on the operation of electronic devices and analysis of the nucleus of digital design the text addresses the impact of interconnect design for low power issues in timing and clocking design methodologies and the effect of design automation on the digital design perspective **FPGA Prototyping by VHDL Examples** Pong P. Chu, 2011-09-20 This book uses a learn by doing approach to introduce the concepts and techniques of VHDL and FPGA to designers through a series of hands on experiments FPGA Prototyping by VHDL Examples provides a collection of clear easy to follow templates for quick code development a large number of practical examples to illustrate and reinforce the concepts and design techniques realistic projects that can be implemented and tested on a Xilinx prototyping board and a thorough exploration of the Xilinx PicoBlaze soft core microcontroller

Design and Test Technology for Dependable Systems-on-Chip Ubar, Raimund, Raik, Jaan, Vierhaus, Heinrich Theodor, 2010-12-31 This book covers aspects of system design and efficient modelling and also introduces various fault models and fault mechanisms associated with digital circuits integrated into System on Chip SoC Multi Processor System on Chip MPSoC or Network on Chip NoC **Design of High-Speed Time-Interleaved Delta-Sigma D/A Converters** Ameya Bhide, 2015-08-19 Digital to analog D A converters or DACs are one the fundamental building blocks of wireless transmitters In order to support the increasing demand for highdata ate communication a large bandwidth is required from the DAC With the advances in CMOS scaling there is an increasing trend of moving a large part of the transceiver functionality to the digital domain in order to reduce the analog complexity and allow easy reconfiguration for multiple radio standards DACs can

fit very well into this trend of digital architectures as they contain a large digital signal processing component and offer two advantages over the traditionally used Nyquist DACs. Firstly, the number of DAC unit current cells is reduced, which relaxes their matching and output impedance requirements, and secondly, the reconstruction filter order is reduced. Achieving a large bandwidth from DACs requires a very high operating frequency of many GHz from the digital blocks due to the oversampling involved. This can be very challenging to achieve using conventional DAC architectures even in nanometer CMOS processes. Time interleaved TIDSM DACs have the potential of improving the bandwidth and sampling rate by relaxing the speed of the individual channels. However, they have received only some attention over the past decade and very few previous works have been reported on this topic. Hence, the aim of this dissertation is to investigate architectural and circuit techniques that can further enhance the bandwidth and sampling rate of TIDSM DACs.

The first work is an 8 GS/s interleaved DAC prototype IC with 200 MHz bandwidth implemented in 65 nm CMOS. The high sampling rate is achieved by a two-channel interleaved MASH 1/1 digital modulator with 3-bit output, resulting in a highly digital DAC with only seven current cells. Two-channel interleaving allows the use of a single clock for both the logic and the analog multiplexing. This requires each channel to operate at half the sampling rate, i.e., 4 GHz. This is enabled by a high-speed pipelined MASH structure with robust static logic. Measurement results from the prototype show that the DAC achieves 200 MHz bandwidth, 57 dBc IM3, and 26 dB SNDR with a power consumption of 68 mW at 1 V digital and 1.2 V analog supplies. This architecture shows good potential for use in the transmitter baseband. While a good linearity is obtained from this DAC, the SNDR is found to be limited by the testing setup for sending high-speed digital data into the prototype. The performance of a two-channel interleaved DAC is found to be very sensitive to the duty cycle of the half-rate clock. The second work analyzes this effect mathematically and presents a new closed-form expression for the SNDR loss of two-channel DACs due to the duty cycle error (DCE) for a noise transfer function (NTF) of $1/z(1-n)$. It is shown that a low-order FIR filter after the modulator helps to mitigate this problem. A closed-form expression for the SNDR loss in the presence of this filter is also developed. These expressions are useful for choosing a suitable modulator and filter order for an interleaved DAC in the early stage of the design process. A comparison between the FIR filter and compensation techniques for DCE mitigation is also presented.

The final work is a 11 GS/s 1.1 GHz bandwidth time interleaved DAC prototype IC in 65 nm CMOS for the 60 GHz radio baseband. The high sampling rate is again achieved by using a two-channel interleaved MASH 1/1 architecture with a 4-bit output, i.e., only fifteen analog current cells. The single clock architecture for the logic and the multiplexing requires each channel to operate at 5.5 GHz. To enable this, a new look-ahead technique is proposed that decouples the two channels within the modulator feedback path, thereby improving the speed as compared to conventional loop unrolling. Full-speed DAC testing is enabled by an on-chip 1 Kb memory whose read path also operates at 5.5 GHz. Measurement results from the prototype show that the DAC achieves 53 dB SFDR, 49 dBc IM3, and 39 dB SNDR within a 1.1 GHz bandwidth while consuming 117 mW from 1 V digital, 1.2 V analog supplies. The proposed DAC can

satisfy the spectral mask of the 60 GHz radio IEEE 802.11ad WiGig standard with a second order reconstruction filter
