A Perspective on Single-Channel Frequency-Domain Speech Enhancement Jacob Benesty, Yiteng Huang, 2022-05-31 This book focuses on a class of single channel noise reduction methods that are performed in the frequency domain via the short time Fourier transform STFT The simplicity and relative effectiveness of this class of approaches make them the dominant choice in practical systems Even though many popular algorithms have been proposed through more than four decades of continuous research there are a number of critical areas where our understanding and capabilities still remain quite rudimentary especially with respect to the relationship between noise reduction and speech distortion All existing frequency domain algorithms no matter how they are developed have one feature in common the solution is eventually expressed as a gain function applied to the STFT of the noisy signal only in the current frame As a result the narrowband signal to noise ratio SNR cannot be improved and any gains achieved in noise reduction on the fullband basis come with a price to pay which is speech distortion In this book we present a new perspective on the problem by exploiting the difference between

speech and typical noise in circularity and interframe self correlation which were ignored in the past By gathering the STFT of the microphone signal of the current frame its complex conjugate and the STFTs in the previous frames we construct several new multiple observation signal models similar to a microphone array system there are multiple noisy speech observations and their speech components are correlated but not completely coherent while their noise components are presumably uncorrelated Therefore the multichannel Wiener filter and the minimum variance distortionless response MVDR filter that were usually associated with microphone arrays will be developed for single channel noise reduction in this book This might instigate a paradigm shift geared toward speech distortionless noise reduction techniques

Speech Enhancement in the STFT Domain Jacob Benesty, Jingdong Chen, Emanuël A.P. Habets, 2011-09-18 This work addresses this problem in the short time Fourier transform STFT domain We divide the general problem into five basic categories depending on the number of microphones being used and whether the interframe or interband correlation is considered The first category deals with the single channel problem where STFT coefficients at different frames and frequency bands are assumed to be independent In this case the noise reduction filter in each frequency band is basically a real gain Since a gain does not improve the signal to noise ratio SNR for any given subband and frame the noise reduction is basically achieved by liftering the subbands and frames that are less noisy while weighing down on those that are more noisy The second category also concerns the single channel problem The difference is that now the interframe correlation is taken into account and a filter is applied in each subband instead of just a gain The advantage of using the interframe correlation is that we can improve not only the long time fullband SNR but the frame wise subband SNR as well The third and fourth classes discuss the problem of multichannel noise reduction in the STFT domain with and without interframe correlation respectively In the last category we consider the interband correlation in the design of the noise reduction filters We illustrate the basic principle for the single channel case as an example while this concept can be generalized to other scenarios In all categories we propose different optimization cost functions from which we derive the optimal filters and we also define the performance measures that help analyzing them

Speech Enhancement in the Karhunen-Loeve Expansion Domain Jacob Benesty, Jingdong Chen, Yiteng Huang, 2022-05-31 This book is devoted to the study of the problem of speech enhancement whose objective is the recovery of a signal of interest i.e speech from noisy observations Typically the recovery process is accomplished by passing the noisy observations through a linear filter or a linear transformation Since both the desired speech and undesired noise are filtered at the same time the most critical issue of speech enhancement resides in how to design a proper optimal filter that can fully take advantage of the difference between the speech and noise statistics to mitigate the noise effect as much as possible while maintaining the speech perception identical to its original form The

optimal filters can be designed either in the time domain or in a transform space As the title indicates this book will focus on developing and analyzing optimal filters in the Karhunen Lo ve expansion KLE domain We begin by describing the basic problem of speech enhancement and the fundamental principles to solve it in the time domain We then explain how the problem can be equivalently formulated in the KLE domain Next we divide the general problem in the KLE domain into four groups depending on whether interframe and interband information is accounted for leading to four linear models for speech enhancement in the KLE domain For each model we introduce signal processing measures to quantify the performance of speech enhancement discuss the formation of different cost functions and address the optimization of these cost functions for the derivation of different optimal filters Both theoretical analysis and experiments will be provided to study the performance of these filters and the links between the KLE domain and time domain optimal filters will be examined Table of Contents Introduction Problem Formulation Optimal Filters in the Time Domain Linear Models for Signal Enhancement in the KLE Domain Optimal Filters in the KLE Domain with Model 1 Optimal Filters in the KLE Domain with Model 2 Optimal Filters in the KLE Domain with Model 3 Optimal Filters in the KLE Domain with Model 4 Experimental Study **Fundamentals of**

Speech Enhancement Jacob Benesty,2018-02-09 This book presents and develops several important concepts of speech enhancement in a simple but rigorous way Many of the ideas are new not only do they shed light on this old problem but they also offer valuable tips on how to improve on some well known conventional approaches The book unifies all aspects of speech enhancement from single channel multichannel beamforming time domain frequency domain and time frequency domain to binaural in a clear and flexible framework It starts with an exhaustive discussion on the fundamental best linear and nonlinear estimators showing how they are connected to various important measures such as the coefficient of determination the correlation coefficient the conditional correlation coefficient and the signal to noise ratio SNR It then goes on to show how to exploit these measures in order to derive all kinds of noise reduction algorithms that can offer an accurate and versatile compromise between noise reduction and speech distortion **Sound Capture and Processing** Ivan Jelev

Audio Source Separation and Speech Enhancement Emmanuel Vincent, Tuomas

Virtanen, Sharon Gannot, 2018-07-24. Learn the technology behind hearing aids, Siri and Echo. Audio source separation and speech enhancement aim to extract one or more source signals of interest from an audio recording involving several sound sources. These technologies are among the most studied in audio signal processing today and bear a critical role in the success of hearing aids, hands free phones, voice command and other noise robust audio analysis systems and music post production software. Research on this topic has followed three convergent paths starting with sensor array processing, computational auditory scene analysis and machine learning based approaches such as independent component analysis respectively. This book is the first one to provide a comprehensive overview by presenting the common foundations and the differences between these techniques in a unified setting. Key features: Consolidated perspective on audio source separation and speech enhancement. Both historical perspective and latest advances in the field, e.g. deep neural networks. Diverse disciplines: array processing, machine learning and statistical signal processing. Covers the most important techniques for both single channel and multichannel processing. This book provides both introductory and advanced material suitable for people with basic knowledge of signal processing and machine learning. Thanks to its comprehensiveness, it will help students select a promising research track, researchers leverage the acquired cross domain knowledge to design improved techniques and engineers and developers choose the right technology for their target application scenario. It will also be useful for practitioners from other fields, e.g. acoustics, multimedia, phonetics and musicology, willing to exploit audio source separation or speech enhancement as pre processing tools for their own needs. **Starting Digital Signal Processing in**

Techniques for Noise Robustness in

Automatic Speech Recognition Tuomas Virtanen, Rita Singh, Bhiksha Raj, 2012-11-28 Automatic speech recognition ASR systems are finding increasing use in everyday life. Many of the commonplace environments where the systems are used are noisy; for example, users calling up a voice search system from a busy cafeteria or a street. This can result in degraded speech recordings and adversely affect the performance of speech recognition systems. As the use of ASR systems increases, knowledge of the state of the art in techniques to deal with such problems becomes critical to system and application engineers and researchers who work with or on ASR technologies. This book presents a comprehensive survey of the state of the art in techniques used to improve the robustness of speech recognition systems to these degrading external influences. Key features: Reviews all the main noise robust ASR approaches including signal separation, voice activity detection, robust feature extraction, model compensation and adaptation, missing data techniques, and recognition of reverberant speech. Acts as a timely exposition of the topic in light of more widespread use in the future of ASR technology in challenging environments. Addresses robustness issues and signal degradation, which are both key requirements for practitioners of ASR. Includes contributions from top ASR researchers from leading research units in the field. **Towards Human-Vehicle Harmonization** Huseyin Abut, Gerhard Schmidt, Kazuya Takeda, Jacob Lambert, John H.L.
