Review the Concepts

Work through the following exercises to review the concepts in this chapter. Use them and the activities on the Web at www.masteringbiology.com. The website offers a variety of tools that will help you plan your studies.

Exercise 1 (Module 35.1)

This module gives an overview of circulatory systems—their basic functions and parts. Review the information by matching the following words and phrases. Each answer is used only once.

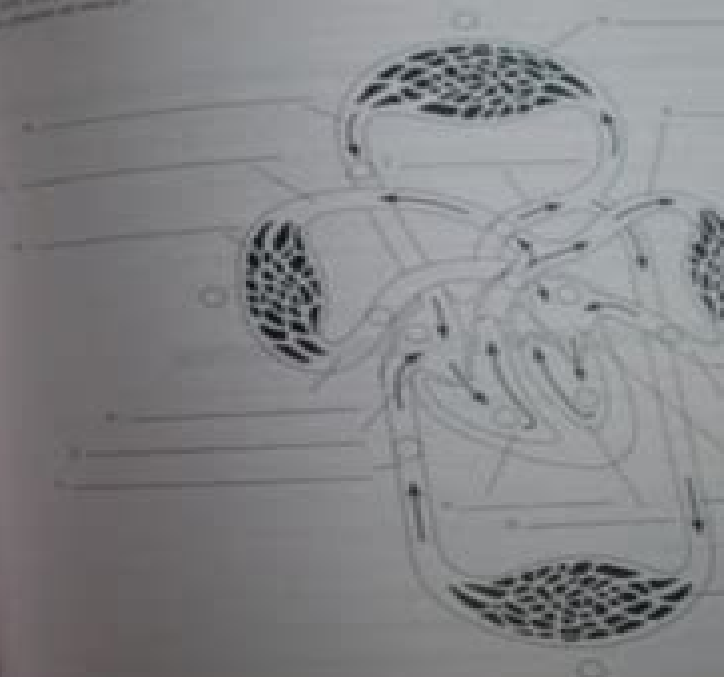

- | | |
|----------------------------------------------------------------------------|--------------------------|
| _____ 1. Network of small blood vessels | A. Ventricle |
| _____ 2. Circulatory system of vertebrates, earthworms, squid, and octopus | B. Open system |
| _____ 3. Cannot transport molecules more than a few cell widths | C. Capillary |
| _____ 4. Vessel that carries blood away from the heart | D. Artery |
| _____ 5. Solution in spaces between cells | E. Blood |
| _____ 6. Heart chamber that pumps blood out via arteries | F. Closed system |
| _____ 7. Carries out circulatory functions in a flatworm or mollusk | G. Capillary bed |
| _____ 8. Circulatory system of insects and mollusks | H. Diffusion |
| _____ 9. Heart chamber that receives blood from veins | I. Interstitial fluid |
| _____ 10. Vessel that conveys blood from arteries to veins in humans | J. Vein |
| _____ 11. Vessel that returns blood to the heart | K. Gastrovascular cavity |
| _____ 12. The circulatory fluid in a closed circulatory system | L. Gut |

Exercise 2 (Module 35.2)

The fish heart pumps blood through two sets of capillaries. As the blood of a fish goes through the tiny gill capillaries, it loses pressure. Therefore, once it has picked up oxygen, it delivers this oxygen to the capillaries in body tissues rather full forcefully. As amphibians adapted to life out of the water, double circulation evolved. The mammal heart is like two fish hearts side by side. Each side pumps blood only through one set of capillaries. The right side of the heart pumps blood only to the lungs. The left side of the heart then takes the pressure and sends this blood on its way to body tissues. This pressure forces blood more efficiently to body tissues, an adaptation to a more vigorous terrestrial lifestyle. Amphibians display an intermediate stage, with a three-chambered heart. Compare the fish and mammal circulatory systems. On the next page, trace the flow of blood through the parts blood passes through in order.

- | | |
|--------------------------------|--------------------------|
| _____ 1. Right ventricle | A. Right ventricle |
| _____ 2. Left ventricle | B. Left ventricle |
| _____ 3. Lung capillaries | C. Lung capillaries |
| _____ 4. Right atrium | D. Right atrium |
| _____ 5. Pulmonary capillaries | E. Pulmonary capillaries |
| _____ 6. Left atrium | F. Left atrium |

Trace the mammalian cardiovascular system, start by labeling the parts indicated in the diagram. Then trace the route that carries oxygen-rich blood out and then that carries oxygen-poor blood back. Finally, label the parts of blood flow by transferring the correct words to the diagram. Some numbers are duplicated between blood vessels with one blood vessel in each stage.
