Role of Autophagy and Reactive Oxygen Species in Cancer Treatment Neeraj Mishra,Ravinder Kumar Kaundal,2024-09-01 Autophagy is a catabolic process that eliminates damaged and faulty cellular components via lysosomes It responds to adverse circumstances like nutritional deficiency hypoxia and oxidative damage Reactive oxygen species ROS cause oxidative stress which is a multidimensional chemical that drives various pathophysiological diseases including cancer In addition the autophagy process has a double role first preventing tumour formation but later fostering tumour progression A growing body of research suggests that autophagy and ROS have a complex interplay in which they can either prevent cancer growth or enhance disease genesis While a combination of autophagy inhibitor and cytotoxic medicines is now being used in cancer treatment investigating the potential of autophagy inhibitors for overcoming resistance to different anticancer medications and how this relates to the control of cancer micro environmental stressors raises several questions Autophagy s dual functions as a safeguarding and cytotoxic process have drawn attention to its significance in the development of cancer
