

Activity A:
Inherited variation

Get the Gizmo ready:

- Set **Red** to 100, **Green** to 255, and **Blue** to 50.

Introduction: An organism's **traits**, or characteristics, are controlled by **genes**. Genes are located on rod-like structures called **chromosomes**. Different versions of genes that code for the same trait are called **alleles**. In this Gizmo, there are 3 genes on each chromosome. For each gene there are eight possible alleles: *W* (white), *R* (red), *G* (green), *B* (blue), *C* (cyan), *M* (magenta), *Y* (yellow), and *K* (black).

Question: Where does variation in a population come from?

1. **Observe:** Hold your cursor over one of the insects. The two rod-like structures under **Genotype** on the right side of the Gizmo represent chromosomes. The three letters next to each chromosome represent alleles.

Which alleles does the insect have? *Two sets of W alleles (WWW, WWW)*

The alleles carried on an organism's chromosomes make up the organism's **genotype**.

2. **Observe:** An organism's alleles combine to produce a trait. The physical expression of that trait is a **phenotype**. In the Gizmo, phenotype is expressed in red, green, and blue values.

A. What is the phenotype of the insect? Red: *255* Green: *255* Blue: *255*

B. What color is the insect? *White*

3. **Run Gizmo:** Move the **Sim. speed** slider all the way to the left. Click **Play** (▶). You will see the insects move to the left in pairs. The pairs mate and produce a set of four offspring. As soon as you see at least one offspring with an oval around it, click **Pause** (⏸). Move your cursor over the circled offspring.

A. What is its genotype and phenotype?

Answers will vary. Sample answer: WWK, WWW; R = 213, G = 213, B = 213

B. How does its genotype and phenotype differ from the non-circled offspring?

Sample answer: There is one different allele in the genotype. The phenotype has a different RGB value.

4. **Explain:** The change in the circled offspring's genotype was caused by a **mutation**. A mutation is a change in a gene. Mutations happen when a mistake is made when a cell's chromosomes are copied. How might mutations introduce variation into a population?

Mutations introduce new alleles into the population. The new alleles can affect the organism's phenotype, thus causing differences (or variations) in the population.

Gizmo Evolution Mutation And Selection Answer:

Evolving Ourselves Juan Enriquez, Steve Gullans, 2015 Though these harbingers of change are deeply unsettling the authors argue that we are also in an epoch of tremendous opportunity New advances in biotechnology help us mitigate the cruel forces of natural selection from saving prematurely born babies to gene therapies for sickle cell anemia and other conditions As technology enables us to take control of our genes we will be able to alter our own species and many others a good thing given that our eventual survival will require space travel and colonization enabled by a fundamental redesign of our bodies Future humans could become great caretakers of the planet as well as a more diverse more resilient gentler and more intelligent species but only if we make the right choices now

Natural Selection J. Phil Gibson, Terri R. Gibson, 2009 In his groundbreaking book Natural Selection Charles Darwin explained his theory that evolution is driven by adaptation of species to their environmental surroundings From the tiniest microbe to the largest whale all organisms have changed over vast expanses of time due to the forces of natural selection This new title in the Science Foundations series provides an overview of the processes and causes that drive natural selection and the principles that explain how it operates using numerous diverse organisms as examples Natural Selection promotes a solid understanding of how organisms change over the course of generations and how current biodiversity came to be

How Science Proves That The Theory Of Evolution Is Impossible, Why Humans Can Never Evolve From Mutations Transpiring, And How Humans Can Be Augmented By Becoming Cyborgs Dr Harrison Sachs, 2020-02-08 This essay sheds light on how science proves that the theory of evolution is impossible and also elucidates why humans can never evolve from mutations transpiring Moreover how humans can be augmented by becoming cyborgs is delineated in this essay In spite of what you were indoctrinated to believe it is not only easier than anytime in history to utilize science to vindicate the existence of God the quintessential divine creator and master of the multiverse but it is also easier to disprove the illogical theory of evolution Human beings were created by God and are sheer and utter consciousness as multidimensional spiritual beings who vicariously experience this simulated reality through their earthly avatars receivers vessels or bodies as most people like to call them Humans were created by God and have profusely devolved overtime from mutations transpiring Mutations are always deleterious and are never beneficial to the human species Mutations always cause you to lose genetic information and never gain genetic information The theory of evolution makes the irrational contention that mutations are beneficial when in fact the polar opposite is true The occurrence of mutations is never salubrious but rather is always deleterious Mutations to the genes are always adverse changes which bastardizes the original genetic code A human being s earthly vessel can never organically change it something outside the parameters of its DNA in this simulation If the human genome can be thought of as a book then the occurrence of a mutation can always be thought of as outright ripping a chapter out of a book hence bastardizing the original genetic code and

devolving the earthly vessel of the being Humans are a maladaptive species that can never possess the ability to physically evolve in this simulated reality because unlike the fictitious Pokemon characters human beings only have the anatomy to physically devolve into lesser humans beings if they succumb to genetic mutations These genetic mutations cause humans beings to loose more and more of their original sacrosanct genetic code and bastardizes their genomes In other words genetic mutations will always adversely impinge on your original genetic code in all facets and will devolve you as you loose more and more of your irreplaceable genetic code in this simulated reality Nothing salubrious nor fruitful can ever ensue from mutations transpiring Another fallacy of the theory of evolution beyond mutation being falsely perceived as beneficial is the groundless notion that something can come from nothing The contention that something can come from nothing in a cause and effect simulated reality does not make any rational sense There is a cause behind every effect and every effect can be traced back to a cause If this fallacy of life emerging from nothing were the case then humans would be spawning out of nowhere In spite of its sheer asininity most people mistakenly believe that humans can come from nothing and are not their own separate species The theory of evolution is a groundless theory that does not offer a modicum of scientific merit in any facet Human beings have devolved overtime due to the deleterious occurrence of genetic mutations Moreover humans beings do not have the anatomy to ever physically evolve in this simulated reality unlike the fictitious Pokemon characters Humans are a maladaptive species that are perhaps preordained to further devolve overtime as they succumb to more and more adverse genetic mutations due to living insalubrious lives fraught with calamitous issues that eminently impinge on their health happiness and well being In other words humans are not even livings salubrious lives and it would behoove humans to focus on living salubrious lives which are conducive to optimizing their health so that they can safeguard the structural integrity of their sacrosanct genetic code and mitigate risks for mutations transpiring

Evolution by Natural Selection
,2006 *Natural Selection and Genetic Drift* Joshua Richardson,2016 Natural selection is the process which being the most important factor of evolution promotes rising of adaptability and prevents destructive consequences of all other processes The concept of natural selection is a discordant problem of evolutionary human genetics Despite popularity of a hypothesis of neutral evolution the majority of scientists consider that selection has played main role in evolution of species and has generated all bio logical diversity of human populations This book presents research on natural selection and genetic drift The author of the first chapter provides an all embracing macroevolutionary perspective on the processes of the evolution of life and culture on earth The author investigates a complementary form of natural selection that diverges from the traditional form in that it is acting independently of the external environment The next chapter discusses natural selection and diabetes mellitus The last chapter examines how the genetic drift among native people from South American the Gran Chaco region affects interleukin 1 receptor antagonist variation
