1. What are two ways you could increase the magnification (increase the size of the image) in the situation shown below?

- A. Move the candle to the right, or the focal point to the left.
- B. Move the candle to the right, or the focal point to the right.
- C. Move the candle to the left, or the focal point to the left.
- D. Move the candle to the left, or the focal point to the right.

Correct Answer: A. Move the candle to the right, or the focal point to the left.

Explanation: For a convex lens, the closer an object is to the focal point, the larger its image is (and therefore the greater the magnification is). The two ways you could make the candle be closer to the focal point are to move the candle to the right, or the focal point to the left.

You answered this question correctly!

2. A large convex lens stands on the floor. The lens is 180 cm tall, so the principal axis is 90 cm above the floor. A student holds a flashlight 120 cm off the ground, shining straight ahead (parallel to the floor) and passing through the lens. The light is bent and intersects the principal axis 60 cm behind the lens. Then the student moves the flashlight 30 cm higher (now 150 cm off the ground), also shining straight ahead through the lens. How far away from the lens will the light intersect the principal axis now?

A ray tracing package through a lens system and spectrometer B. Zurro, P. W. King, E. A. Lazarus, 1980 **Ray Tracing Package Through a Lens System and a Spectrometer**, 1980 To study the light collection optics of the ISX B two dimensional 2 D Thomson scattering system we have implemented in the Oak Ridge National Laboratory ORNL Fusion Energy Division FED PDP 10 two computer programs LENS and SPECT that trace rays through a lens system and a spectrometer respectively The lens package follows the path of any kind of ray meridional or skew through a centered optical system formed by an arbitrary number of spherical surfaces The spectrometer package performs geometrical ray tracing through a Czerney Turner spectrometer and can be easily modified for studying any other configuration Contained herein is a description of the procedures followed and a listing of the computer programs Lens Design Fundamentals Rudolf Kingslake, 1978-04-28 A large part of this book is devoted to a study of possible design procedures for various types of lens or mirror systems with fully worked examples of each The reader is urged to follow the logic of these examples and be sure that he understands what is happening noticing particularly how each available degree of freedom is used to control one aberration Not every type of lens has been considered of course but the design techniques illustrated here can readily be applied to the design of other more complex systems It is assumed that the reader has access to a small computer to help with the ray tracing otherwise he may find the computations so time consuming that he is liable to lose track of what he is trying to accomplish **Considerations in the Design and Production of Cartographic Lenses** Robert M. Spriggs, 1968 Contents Geometry Photo resolution Design of the lens Types of aberration Fabrication Lens barrel and Distortion effects

Properties and Applications of Generalized Ray Tracing Steven Craig Parker, 1971 **Field Guide to Lens Design** Julie L. Bentley, Craig Olson, 2012 The process of designing lenses is both an art and a science While advances in the field over the past two centuries have done much to transform it from the former category to the latter much of the lens design process remains encapsulated in the experience and knowledge of industry veterans This SPIE Field Guide provides a working reference for practicing physicists engineers and scientists for deciphering the nuances of basic lens design

Simplified Method of Tracing Rays Ludwik Silberstein, 2015-07-21 Excerpt from *Simplified Method of Tracing Rays Through Any Optical System of Lenses Prisms and Mirrors* The aim of the present volume is to set forth a method of treating the geometrical optics of any given system intrinsically that is to say without introducing any artificial scaffolding and therefore without any arbitrary splitting of the entities involved in the problem of tracing a luminous ray through the several surfaces of a system The resultant formulae in vector language of course as the only appropriate means of intrinsic expression will then be free of any unnecessary elements and therefore if finally translated into any set of scalar formulae for the practical use of the numerical computer will contain no superfluous geometrical or arithmetical complications Our purpose is not to treat the whole subject of geometrical optics but exclusively or almost so that part of it which is called by

the short name of ray tracing This is notoriously the most laborious part of the computers patient work and becomes without question a formidable task when he has to deal with skew rays and non centred systems The problem thus limited can be put shortly Given the ray incident upon any system of lenses mirrors and prisms find the emergent ray The advantages of the vectorial method of resolving it must not be judged by the conspicuous shortness of the resultant formulae alone but also by the simplicity of their deduction as compared with the usual method and by the facility of recalling the formulae or of reconstructing them if forgotten Again the nature of the proposed method is such as to make the help of drawings which especially in the case of skew rays become in the best standard treatises exceedingly complicated almost superfluous This circumstance will be particularly welcome to readers who are not endowed with strong visualising powers About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

Characterization of Aspherical Lenses by Experimental Ray Tracing Ufuk Ceyhan,2013 [Ray Tracing Confirms the Optical Properties of the Bovine Lens are Actively Maintained by the Microcirculation System](#) Chen Qiu,2019

Ocular pathologies such as cataract have become increasingly common as the human population continues to age due to better healthcare As such the need for an improved understanding of the underlying causes is necessary Using a variety of Magnetic Resonance Imaging MRI modalities and optical modelling software the Molecular Vision Laboratory MVL has shown that the lens geometry and the gradient of refractive index GRIN which together determine the optical properties of the ocular lens are actively maintained by the lens microcirculation system Based on a series of experiments the MVL have proposed that monitoring the optical properties of lens could serve as a good indicator at the whole tissue level of the underlying state of the cellular physiology of the lens To investigate this hypothesis I have developed a novel laser ray tracing LRT system that allows the optical properties of isolated bovine lenses maintained in organ culture to be measured A fully automated LRT system capable of passing multiple rays at different projection angles through bovine lenses maintained in organ culture was developed The lens geometry was quantitatively analysed by detecting the edge of the lens using state of the art segmentation methods Retrieval of the lens GRIN involved solving an optimization problem that is constructed from information in the ray deflections This optimization process was aided by a set of physiologically and optically relevant constraints These constraints included a decreasing refractive index from the lens core radially outward towards the lens surface and a homogenous index at the surface of the lens that was consistent with the lens growth rings that are formed during lens development In some instances information of the absolute refractive index of the lens was also required The

overall lens optics determined by the product of the lens geometry and GRIN was then validated by comparing the ray trajectories computed using ray theory simulations to direct experimental trajectories extracted from the original ray tracing images I then used this system to monitor the time course of changes to lens geometry GRIN and power in bovine lenses organ cultured in the absence and presence of reagents known to alter the cellular physiology of the lens Lenses cultured in Artificial Aqueous Humor AAH for up to four hours maintained relatively constant power geometry and GRIN over time In contrast lens incubated in a high concentration of K High K AAH which inhibits the microcirculation system by depolarizing the lens potential exhibited a rounding in lens geometry but a decrease in GRIN which resulted in a small but significant increase in overall power A similar effect on lens geometry GRIN and power was observed in lenses perfused with 100% CO₂ which by altering lens pH closes gap junctions in the outer cortex of the lens In contrast incubating lenses in ouabain 1 mM to block the Na K ATPase that drives the lens microcirculation caused a more pronounced rounding of lens shape an increase in GRIN that was more prominent in the lens core relative to the outer cortex and a substantial increase in optical power Using LRT to directly measure lens optics I have confirmed earlier MRI experiments that showed the microcirculation system actively controls the optical properties of the lens Furthermore I have shown that inhibiting different components lens potential gap junctional conductance and Na pump current of the lens microcirculation system differentially affects the lens optical properties
