Global Data Management R. Baldoni, G. Cortese, F. Davide, 2006-07-26 An unforeseen growth of the volume and diversity of the data content and knowledge is being generated all over the globe Several factors lead to this growing complexity among them Size the sheer increase in the numbers of knowledge producers and users and in their production use capabilities Pervasiveness in space and time of knowledge knowledge producers and users Dynamicity new and old knowledge items will appear and disappear virtually at any moment and Unpredictability the future dynamics of knowledge are unknown not only at design time but also at run time The situation is made worse by the fact that the complexity of knowledge grows exponentially with the number of interconnected components The traditional approach of knowledge management and engineering is top down and centralised and depends on fixing at design time what can be expressed and how Global Data Management is playing a crucial role in the development of our networked distributed society Its importance has been recognised in the IST programme since several years in particular in its long term research part Future and Emerging Technologies FET Many of the papers included in this book refer to IST and FET projects currently running or recently completed Data Management for Global Change, 1990 Interagency Session on Data Management for Global Change, 1989 Practical International Data Management Graham R. Bidirectional Collaborative Data Management Zhenjiang Hu, Makoto Onizuka, Masatoshi Yoshikawa, 2024-12-11 This book summarizes the results of solving the two issues from a 5 year national project in Japan called Bidirectional Information Systems for Collaborative Updatable Interoperable and Trusted Sharing BISCUITS since 2017 with researchers from the National Institute of Informatics Osaka University Kyoto University Nanzan University Hosei University Tohoku University and University of Tokyo It provides a big picture of the research results insights and the new perspectives achieved during the project paving the way for future further investigation Along with the continuous evolution of data management systems for the new market requirements we are moving from centralized systems which had often led to vast and monolithic databases toward decentralized systems where data are maintained in different sites with autonomous storage and computation capabilities A common practice is the collaboration or acquisition of companies there is a large demand for different systems to be connected to provide valuable services to users yet each company has its own goal and often builds its own applications and database systems independently without federating with others As a result we need to construct a decentralized system by integrating the independently built databases through schema matching data transformation and update propagation from one database to another There are two fundamental issues with such decentralized systems local privacy and global consistency By local privacy the owner of the data stored on a site may wish to control and share data by deciding what information should be exposed and how its information should be used and updated by other systems By global consistency the systems may wish to have a globally consistent view of all data integrate data from different sites perform analysis through queries and update the integrated data
