Herbivory involves eating plants. Predation involves eating other animals. Omnivory involves eating both plants and animals. Each of these feeding types has evolved independently in different groups of organisms. For example, filter feeding is found in both invertebrates and vertebrates, while herbivory is found in both invertebrates and vertebrates. Omnivory is found in both invertebrates and vertebrates. The evolution of feeding types is a result of the evolution of the digestive system. The digestive system is the organ system that breaks down food into nutrients that can be used by the body. The digestive system is found in all animals, and its evolution has allowed animals to eat a wider variety of foods. This has led to the evolution of different feeding types. For example, the evolution of the digestive system in vertebrates allowed them to eat a wider variety of foods, including meat. This led to the evolution of predation. The evolution of the digestive system in invertebrates allowed them to eat a wider variety of foods, including plants. This led to the evolution of herbivory. The evolution of the digestive system in both invertebrates and vertebrates allowed them to eat a wider variety of foods, including both plants and animals. This led to the evolution of omnivory.
