## **Engineering Rock Mass Classification Tunnelling Foundations And Landslides:**

**Engineering Rock Mass Classification** R K Goel, Bhawani Singh, 2011-08-09 Rock mass classification methods are commonly used at the preliminary design stages of a construction project when there is very little information. It forms the bases for design and estimation of the required amount and type of rock support and groundwater control measures. Encompassing nearly all aspects of rock mass classifications in detail, *Civil Engineering Rock Mass Classification Tunnelling Foundations and Landslides* provides construction engineers and managers with extensive practical knowledge which is time tested in the projects in Himalaya and other parts of the world in complex geological conditions. Rock mass classification is an essential element of feasibility studies for any near surface construction project prior to any excavation or disturbances made to earth. Written by an author team with over 50 years of experience in some of the most difficult mining regions of the world, *Civil Engineering Rock Mass Classification Tunnelling Foundations and Landslides* provides construction engineers, construction managers and mining engineers with the tools and methods to gather geotechnical data either from rock cuts, drifts or core and process the information for subsequent analysis. The goal is to use effective mapping techniques to obtain data that can be used as input for any of the established rock classification systems. The book covers all of the commonly used classification methods including Barton's Q and Q systems, Bieniawski's RMR, Laubscher's MRMR and Hoek's and GSI systems. With this book in hand, engineers will be able to gather geotechnical data either from rock cuts, drifts or core and process the information for subsequent analysis. Rich with international case studies and worked out equations, the focus of the book is on the practical gathering of information for purposes of analysis and design. Identify the most significant parameters influencing the behaviour of a rock mass. Divide a particular rock mass formulation into groups of similar behaviour. Rock mass classes of varying quality. Provide a basis of understanding the characteristics of each rock mass class. Relate the experience of rock conditions at one site to the conditions and experience encountered at others. Derive quantitative data and guidelines for engineering design. Provide common basis for communication between engineers and geologists.

**Landslides: Analysis, Modeling and Mitigation** Kripamoy Sarkar, Sarada Prasad Pradhan, Trilok Nath Singh, 2025-03-18 The book aims to enhance understanding of landslides by focusing on detection, prediction and monitoring. Recently, the number of significant landslides and the damage they cause has increased globally. Landslides are among the most devastating natural hazards resulting in widespread damage to habitats on local, regional and global scales. Experts from around the world have shared their experiences in landslide research and practice which may help stakeholders mitigate and predict these events. The book comprises chapters on Dynamics, mechanisms and processes of landslides, Mapping and assessment of hazard, vulnerability and risk associated with landslides, Geological, geotechnical, hydrological and geophysical modelling for landslides, Numerical simulation of slope to analyse their stability, Monitoring and early warning of landslides, Application of remote sensing and GIS techniques in monitoring and assessment of landslides.
