Multimedia data comprising of images audio and video is becoming increasingly common The decreasing costs of consumer electronic devices such as digital cameras and digital camcorders along with the ease of transportation facilitated by the Internet has lead to a phenomenal rise in the amount of multimedia data generated and distributed Given that this trend of increased use of multimedia data is likely to accelerate there is an urgent need for providing a clear means of capturing storing indexing retrieving analyzing and summarizing such data Content based access to multimedia data is of primary importance since it is the natural way by which human beings interact with such information To facilitate the content based access of multimedia information the first step is to derive feature measures from these data so that a feature space representation of the data content can be formed This can subsequently allow for mapping the feature space to the symbol space semantics either automatically or through human intervention Thus signal to symbol mapping useful for any practical system can be successfully achieved Perspectives on Content Based Multimedia Systems provides a comprehensive set of techniques to tackle these important issues This book offers detailed solutions to a wide range of practical problems in building real systems by providing specifics of three systems built by the authors While providing a systems focus it also equips the reader with a keen understanding of the fundamental issues including a formalism for content based multimedia database systems multimedia feature extraction object based techniques signature based techniques and fuzzy retrieval techniques The performance evaluation issues of practical systems is also explained This book brings together essential elements of building a content based multimedia database system in a way that makes them accessible to practitioners in computer science and electrical engineering It can also serve as a textbook for graduate level courses *Database and*

Understanding Information Retrieval Systems Marcia J. Bates, 2011-12-20. In order to be effective for their users, information retrieval (IR) systems should be adapted to the specific needs of particular environments. The huge and growing array of types of information retrieval systems in use today is on display in *Understanding Information Retrieval Systems: Management Types and Standards*, which addresses over 20 types of IR systems. These various system types in turn present both technical and management challenges which are also addressed in this volume. In order to be interoperable in a networked environment, IR systems must be able to use various types of technical standards, a number of which are described in this book, often by their original developers. The book covers the full context of operational IR systems, addressing not only the systems themselves but also human user search behaviors, user-centered design and management, and policy issues. In addition to theory and practice of IR system design, the book covers Web standards and protocols, the Semantic Web, XML, information retrieval, Web, social mining, search engine optimization, specialized museum and library online access, records compliance and risk management, information storage technology, geographic information systems and data transmission protocols. Emphasis is given to information systems that operate on relatively unstructured data such as text, images and music. The book is organized into four parts. Part I supplies a broad level introduction to information systems and information retrieval systems. Part II examines key management issues and elaborates on the decision process around likely information system solutions. Part III illustrates the range of information retrieval systems in use today, discussing the technical, operational and administrative issues for each type. Part IV discusses the most important organizational and technical standards needed for successful information retrieval. This volume brings together authoritative articles on the different types of information

systems and how to manage real world demands such as digital asset management network management digital content licensing data quality and information system failures It explains how to design systems to address human characteristics and considers key policy and ethical issues such as piracy and preservation Focusing on web based systems the chapters in this book provide an excellent starting point for developing and managing your own IR systems **Multimedia Database**
