Contrasts And Effect Sizes In Behavioral Research A Correlational Approach:

Contrasts and Effect Sizes in Behavioral Research Robert Rosenthal, Ralph L. Rosnow, Donald B. Rubin, 1999-12-28

Contrasts are statistical procedures for asking focused questions of data Researchers teachers of research methods and graduate students will be familiar with the principles and procedures of contrast analysis included here But they for the first time will also be presented with a series of newly developed concepts measures and indices that permit a wider and more useful application of contrast analysis This volume takes on this new approach by introducing a family of correlational effect size estimates By returning to these correlations throughout the book the authors demonstrate special adaptations in a variety of contexts from two group comparison to one way analysis of variance contexts to factorial designs to repeated measures designs and to the case of multiple contrasts

Contrasts and Effect Sizes in Behavioral Research Robert Rosenthal, Ralph L. Rosnow, Donald B. Rubin, 2000 Contrasts are statistical procedures for asking focused questions of data Compared to diffuse or omnibus questions focused questions are characterized by greater conceptual clarity and greater statistical power when examining those focused questions If an effect truly exists we are more likely to discover it and to believe it to be real when asking focused questions rather than omnibus ones Researchers teachers of research methods and graduate students will be familiar with the principles and procedures of contrast analysis but will also be introduced to a series of newly developed concepts measures and indices that permit a wider and more useful application of contrast analysis This volume takes on this new approach by introducing a family of correlational effect size estimates

Designing Experiments and Analyzing Data Scott E. Maxwell, Harold D. Delaney, 2003-10-17 Through this book's unique model comparison approach students and researchers are introduced to a set of fundamental principles for analyzing data After seeing how these principles can be applied in simple designs students are shown how these same principles also apply in more complicated designs Drs Maxwell and Delaney believe that the model comparison approach better prepares students to understand the logic behind a general strategy of data analysis appropriate for various designs and builds a stronger foundation which allows for the introduction of more complex topics omitted from other books Several learning tools further strengthen the reader's understanding flowcharts assist in choosing the most appropriate technique an equation cross referencing system aids in locating the initial detailed definition and numerous summary equation tables assist readers in understanding differences between different methods for analyzing their data examples based on actual research in a variety of behavioral sciences help students see the applications of the material numerous exercises help develop a deeper understanding of the subject Detailed solutions are provided for some of the exercises and realistic data sets allow the reader to see an analysis of data from each design in its entirety Updated throughout the second edition features significantly increased attention to measures of effects including confidence intervals strength of association and effect size estimation for complex and simple designs an increased use of statistical packages and the graphical presentation of data new chapters 15

the current controversies regarding statistical reasoning such as the latest debates on hypothesis testing ch 2 a new preview of the experimental designs covered in the book ch 2 a CD with SPSS and SAS data sets for many of the text exercises as well as tutorials reviewing basic statistics and regression and a Web site containing examples of SPSS and SAS syntax for analyzing many of the text exercises Appropriate for advanced courses on experimental design or analysis applied statistics or analysis of variance taught in departments of psychology education statistics business and other social sciences the book is also ideal for practicing researchers in these disciplines A prerequisite of undergraduate statistics is assumed An Instructor's Solutions Manual is available to those who adopt the book for classroom use

Media Violence and Children Douglas A. Gentile, 2014-09-30 Stripping away the hype this book describes

how when and why media violence can influence children of different ages giving parents and teachers the power to maximize the media's benefits and minimize its harm. There are many opinions about media violence and children but not all are supported by science. In this book the top experts gather the latest results from 50 years of scientific study as the basis for a comprehensive in depth examination of the complex issues surrounding the effects of media violence of different types. Each chapter focuses on a particular issue of concern including hot topics such as brain development, cyber bullying, video games and verbal aggression. Articles take into account factors such as economic differences based on the ages of children and differences between types of media violence. This book provides the information parents and those who work with families need to make the best choices. It includes chapters specifically relevant to the types of bullying schools have the most trouble identifying and controlling. Most importantly the writing is both intelligent and accessible so that parents, educators, pediatricians and policymakers can understand and apply the findings presented.

Comparing Groups Andrew S. Zieffler, Jeffrey R. Harring, Jeffrey D. Long, 2012-01-10 A hands on guide to using R to carry out key statistical practices in educational and behavioral sciences research. Computing has become an essential part of the day to day practice of statistical work broadening the types of questions that can now be addressed by research scientists applying newly derived data analytic techniques. Comparing Groups: Randomization and Bootstrap Methods Using R emphasizes the direct link between scientific research questions and data analysis. Rather than relying on mathematical calculations this book focuses on conceptual explanations and the use of statistical computing in an effort to guide readers through the integration of design, statistical methodology and computation to answer specific research questions regarding group differences. Utilizing the widely used, freely accessible R software the authors introduce a modern approach to promote methods that provide a more complete understanding of statistical concepts. Following an introduction to R each chapter is driven by a research question and empirical data analysis is used to provide answers to that question. These examples are data driven inquiries that promote interaction between statistical methods and ideas and computer application. Computer code and output are interwoven in the book to illustrate exactly how each analysis is carried out and how output is interpreted. Additional topical coverage includes Data exploration of one variable and multivariate data, Comparing two groups and many groups, Permutation tests, randomization tests and the independent samples t Test, Bootstrap tests and bootstrap intervals, Interval

estimates and effect sizes Throughout the book the authors incorporate data from real world research studies as well as chapter problems that provide a platform to perform data analyses A related Web site features a complete collection of the book's datasets along with the accompanying codebooks and the R script files and commands allowing readers to reproduce the presented output and plots Comparing Groups Randomization and Bootstrap Methods Using R is an excellent book for upper undergraduate and graduate level courses on statistical methods particularly in the educational and behavioral sciences The book also serves as a valuable resource for researchers who need a practical guide to modern data analytic and computational methods
