Gilbert, 2012-12-06 The juvenile hormones of insects are unique molecules in terms of their chemical nature methyl esters of sesquiterpene epoxides and action both as modulators of morphogenesis during the larval life of insects and as a gonadotropic agent in many female adults Although a symposium dedicated to the chemistry metabolism and effects of juvenile hormone at a number of levels would be merited on the basis of its interest to the chemist physiologist endocrinologist developmental biologist and entomologist the juvenile hormones are special in the sense that juvenile hormone mimics juvenoids insect growth regulators analogs are currently being utilized to control various insect pests Indeed a number of commercial firms are currently developing new compounds with juvenile hormone activity that might possess a narrow spectrum of activity and which would be relatively biodegradable Thus a symposium on the juvenile hormones is also merited on a practical basis since juvenoids are already becoming constituents of our environment and it is apparent that in order to design effective mimics of the natural juvenile hormones one should understand the means by which juvenile hormone elicits its effects As will become evident to the reader the great majority of data presented at this symposium have not been published previously and the symposium itself was organized along natural divisions dealing with the chemistry metabolism and multi level modes of action of the juvenile hormones Special lectures were presented by Professors C M Williams B W O Malley and W S *Science Fair Project Index 1973-1980* Akron-Summit County Public Library. New Perspectives on the History of Life Sciences and Agriculture Denise Phillips, Sharon Kingsland, 2015-02-12 This volume explores problems in the history of science at the intersection of life sciences and agriculture from the mid

eighteenth to the mid twentieth century Taking a comparative national perspective the book examines agricultural practices in a broad sense including the practices and disciplines devoted to land management forestry soil science and the improvement and management of crops and livestock The life sciences considered include genetics microbiology ecology entomology forestry and deal with US European Russian Japanese Indonesian Chinese contexts The book shows that the investigation of the border zone of life sciences and agriculture raises many interesting questions about how science develops In particular it challenges one to re examine and take seriously the intimate connection between scientific development and the practical goals of managing and improving perhaps even recreating the living world to serve human ends Without close attention to this zone it is not possible to understand the emergence of new disciplines and transformation of old disciplines to evaluate the role and impact of such major figures of science as Humboldt and Mendel or to appreciate how much of the history of modern biology has been driven by national ambitions and imperialist expansion in competition with rival nations
