exist despite often quite extensive overlap in ecological requirements Putman explores the potential for competition competition tolerance and even positive facilitation amongst the members of such guilds of ungulates As a central worked example the author employs data resulting from over 20 years of personal research into the ecology and population dynamics of various large herbivores of the New Forest in Southern England With these he applies formal protocols in resource use evidence for resource limitation and evidence for interaction between species in changing population size over the years

European Ungulates and Their Management in the 21st Century Marco Apollonio, Reidar Andersen, Rory Putman, 2010-02-04 The first book to summarise management objectives for ungulates across Europe

Bioenergetics Of Wild Herbivores Robert J. Hudson, 2018-01-18 Bioenergetics is an emerging discipline which offers a more profound understanding of the ecology behaviour and evolution of wild herbivores Increasingly bioenergetic principles have been applied in management since they provide insight into population dynamics and are relevant to manipulation of habitats and assessment of the impacts of resource development Growing interest in the agricultural potential of wild herbivores has provided further impetus In spite of this promise there are few comprehensive syntheses of the concept and its application to wild herbivores This volume attempts to fill this need This book provides a great amount of detail but its expressive aim is to lead us to the whole animal to a herd to population as integral parts of an ecological entity which in turn is the result of evolutionary forces The concept of this book promises the realization of an overdue change in the approach to bioenergetics

to nutrition and husbandry and thus to the management of wild herbivores the final emancipation from rules and views based primarily on domesticated herbivores or on experimental animals held under unnatural conditions necessarily impending them behaviourally physically and psychically

Leks Jacob Höglund, Rauno V. Alatalo, 1995 The evolution of leks clusters of small territories where males congregate and display in order to attract mates is of central issue in behavioral ecology because of the insights it offers into female mate choice sexual selection and the evolution of mating systems In the first book on the subject Jacob Höglund and Rauno Alatalo draw together existing knowledge on two main aspects of lekking Why do leks evolve in some species and not in others Why do females of certain lekking species select their mates even though such behavior reaps few or no material benefits for them In each case they emphasize the importance of understanding the selective forces that act on individuals in natural populations Höglund and Alatalo synthesize the available information on lekking in all animal groups and suggest new areas of research Originally published in 1995 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905

Fallow Deer (Dama Dama) Norma G. Chapman, Donald I. Chapman, British Deer Society, 1978 *Mammalia* Bannister, 2024-02-19 BIOL & MGMT CERVIDAE Christen M. Wemmer, 1987-11-17 A conference held at the Conservation and Research Center National Zoological Park Smithsonian Institution Front Royal Virginia August 1 5 1982 **Deer** George A. Feldhamer, William J. McShea, 2012-01-26 Think of deer and the image that pops into most American's minds is that of a white-tailed deer, the most common large mammal in North America. Most Europeans are more familiar with red deer. It may surprise many people to know that there are actually about 50 species of deer found throughout the world. Here readers will find nontechnical expert information about the wide range of diverse deer species. Did you know that elk and caribou are deer? Or that the earliest fossils of deer are 15 to 20 million years old? Have you ever wondered whether deer swim, play, or see color? How do deer avoid predators and survive the winter? Do deer make good pets or carry contagious diseases? George A. Feldhamer and William J. McShea answer these and other intriguing questions about members of the deer family Cervidae. From the diminutive pudu of South America that weighs 17 pounds to male moose that weigh close to 2,000 pounds, Feldhamer and McShea explore the biology, evolution, ecology, feeding habits, reproduction, and behavior of deer. They chronicle the relationships between humans and deer, both positive and negative, and discuss the challenges of deer conservation and management. With vivid color photographs and an accessible and engaging question-and-answer format, this easy-to-read book is the go-to resource on deer. Nature lovers, hunters, and anyone curious about deer will find this fact-filled book both fascinating and full of surprises.

Hoofed Mammals of British Columbia David M. Shackleton, Royal British Columbia Museum, 1999 Hoofed mammals (ungulates) are the most abundant large mammals in the world. They are also plentiful in British Columbia, which is home to nine wild native species: moose, elk, caribou, bison, mountain goat, two species of deer, and two of sheep. There are also several introduced species. In *Hoofed Mammals of British Columbia*, David Shackleton presents a comprehensive summary of the most up-to-date information on these ungulates. In the well-illustrated introduction, he discusses their evolution and biology, survival adaptations, and social organization. He also covers conservation issues, tracking, and taxonomy. In the species accounts, he describes each species and subspecies and discusses their natural history, habitat, diet, behaviour, reproduction, life expectancy, and mortality factors, and predators. Each account includes a distribution map and data on taxonomy, recent population estimates, conservation status, and traditional aboriginal use. Excellent illustrations, and two keys help identify each species by its external features or its skull. *Hoofed Mammals of British Columbia* is the third of six handbooks on the mammals of British Columbia, a Royal B.C. Museum project to update and expand the classic treatment by Ian McTaggart Cowan and Charles Guiguet. *The Mammals of British Columbia*, last revised in 1965.
