Physical Activity, Self-Regulation, and Executive Control Across the Lifespan Sean P. Mullen, Peter Hall, 2016-02-05 There is overwhelming evidence linking increased physical activity with positive changes in cognitive functioning and brain health Much of what we know about these interrelationships comes

from aerobic exercise training studies with older adults and children This literature has paved the way for the neuroscientific investigation of mechanisms responsible for exercise induced cognitive and brain health enhancement a list that ranges from molecular changes to systemic changes in executive control and neural connectivity A new perspective has also emerged that aims to understand executive control processes that may underlie the regulation of health behavior In accordance with this view physical activity falls under the umbrella of health behaviors that require a substantial amount of executive control Executive control is a limited resource and the aging process depletes this resource People who regularly exercise are said to have higher self regulatory control planning goal shielding and impulse control than irregular exercisers The successful maintenance of physical activity participation in lieu of daily cognitive stressors likely reflects an adaptive resistance to control failures Indeed a handful of studies have shown the relationship between greater executive control and subsequently higher levels of physical activity However little is known about the neural correlates of physical activity adherence or sedentary behavior with the view that neurocognitive factors have an antecedent and reciprocal influence on these behaviors No research has focused on the brain networks responsible for the self regulation of physical activity which likely overlaps with structures and functions playing critical roles in the regulation of other health behaviors Interdisciplinary investigations are needed to explain the extent to which physical activity self regulation and self regulatory failure is dependent upon or under the influence of executive control processes and brain networks Understanding the degree to which self regulatory resources may be enhanced restored and trained will have enormous implications for basic science and applied fields It is also of great import to understand whether or not physical activity self regulation is a domain specific behavior associated with specific brain networks or to determine the extent to which regulatory network sharing occurs The aim of this Frontiers Research Topic is to curate contributions from researchers in social and cognitive neurosciences and related fields whose work involves the study of physical activity behavior self regulation and executive control For this Research Topic we therefore solicit reviews original research articles and opinion papers which draw theoretical or empirical connections related to sustained physical activity behavior self regulatory strategies cognitive performance and brain structure and function While focusing on work in the neurosciences this Research Topic also welcomes contributions in the form of behavioral studies psychophysiological investigations and methodological innovations This Frontiers Research Topic will carve out new directions for the fields of exercise cognitive and social neurosciences We hope you will consider submitting your work

From the Couch to the Lab Aikaterini Fotopoulou, Donald Pfaff, Martin A. Conway, 2012-05-17 Can the psychodynamics of the mind be correlated with neurodynamic processes in the brain The book revisits this important question one that scientists and psychoanalysts have been asking for more than a century Freud envisioned that the separation between the two approaches was just a temporary limitation that future scientific progress would overcome Yet only recently have scientific developments shown that he was right Technological and methodological innovations in

neuroscience allow unprecedented insight into the neurobiological basis of topics such as empathy embodiment and emotional conflict As these domains have traditionally been the preserve of psychoanalysis and other fields within the humanities rapprochement between disciplines seems more important than ever Recent advances in neurodynamics and computational neuroscience also reveal richer and more dynamic brain mind relations than those previously sketched by cognitive sciences Are we therefore ready to correlate some neuroscientific concepts with psychoanalytic ones Can the two disciplines share a common conceptual framework despite their different epistemological perspectives The book brings together internationally renowned contributors from the fields of Psychoanalysis Neuroscience and Neuro psychoanalysis to address these questions The volume is organised in five clear sections Motivation Emotion Conscious and Unconscious Processes Cognitive Control and Development of the Self With a range of chapters written by leading figures in their fields it gives the reader a strong flavour of how much has already been achieved between the disciplines and how much more lies ahead This important new book reveals the intrinsic challenges and tensions of this interdisciplinary endeavour and emphasises the need for a shared language and new emerging fields such as Psychodynamic Neuroscience

Bainbridge,2011-09-06 The newest communication technologies are profoundly changing the world s politics economies and cultures but the specific implications of online game worlds remain mysterious The Virtual Future employs theories and methods from social science to explore nine very different virtual futures The Matrix Online Tabula Rasa Anarchy Online Entropia Universe Star Trek Online EVE Online Star Wars Galaxies World of Warcraft Burning Crusade and The Chronicles of Riddick Each presents a different picture of how technology and society could evolve in coming centuries but one theme runs through all of them the attempt to escape the Earth and seek new destinies among the stars Four decades after the last trip to the moon a new conception of spaceflight is emerging Rather than rockets shooting humans across vast physical distances to sterile rocks that lack the resources to sustain life perhaps robot space probes and orbiting telescopes will glean information about the universe that humans can then experience inside computer generated environments much closer to home All nine of these fantastically rich multiplayer masterpieces have shown myriads of people that really radical alternatives to contemporary society could exist and has served as a laboratory for examining the consequences Each is a prototype of new social forms a utopian subculture and a simulation of technologies that have yet to be invented They draw upon several different traditions of science fiction and academic philosophy and they were created in several nations By comparing these nine role playing fantasies we can better consider what kind of world we want to inhabit in the real future
