Laser Cooling and Trapping Harold J. Metcalf, Peter van der Straten, 2012-12-06 Laser cooling is a relatively new technique that has led to insights into the behavior of atoms as well as confirming with striking detail some of the fundamental notions of quantum mechanics such as the condensation predicted by S N Bose This elegant technique whereby atoms molecules and even microscopic beads of

glass are trapped in small regions of free space by beams of light and subsequently moved at will using other beams provides a useful research tool for the study of individual atoms and clusters of atoms for investigating the details of chemical reactions and even for determining the physical properties of individual macromolecules such as synthetic polymers and DNA. Intended for advanced undergraduates and beginning graduate students who have some basic knowledge of optics and quantum mechanics, this text begins with a review of the relevant results of quantum mechanics; it then turns to the electromagnetic interactions involved in slowing and trapping atoms and ions in both magnetic and optical traps. The concluding chapters discuss a broad range of applications from atomic clocks and studies of collision processes to diffraction and interference of atomic beams at optical lattices and Bose-Einstein condensation.

Mathematical Aspects of Quantization Sam Evens, 2012. This book is a collection of expository articles from the Center of Mathematics at Notre Dame's 2011 program on quantization. Included are lecture notes from a summer school on quantization on topics such as the Cherednik algebra, geometric quantization, detailed proofs of Willwacher's results on the Kontsevich graph complex, and group-valued moment maps. This book also includes expository articles on quantization and automorphic forms, renormalization, Berezin-Toeplitz quantization in the complex setting, and the commutation of quantization with reduction, as well as an original article on derived Poisson brackets. The primary goal of this volume is to make topics in quantization more accessible to graduate students and researchers.

Quantum Symmetries Thomas Creutz, Julia Plavnik, David Ridout, 2025-03-19. This volume contains the proceedings of the thematic program on Quantum symmetries, Tensor categories, topological quantum field theories, and vertex algebras, held from October 10 to November 4, 2022, at the Centre de Recherches Mathématiques, Montréal, Québec, Canada. Quantum symmetries is a rapidly expanding area in which tensor categories are applied to mathematical physics, in particular to conformal and topological quantum field theories. These fields, in turn, connect to a huge variety of modern mathematics, including representation theory, vertex operator algebras, Hopf algebras, link and knot invariants, geometry, subfactors, combinatorics, and so much more. The thematic program on quantum symmetries featured advanced lecture courses and research seminars by international leaders of their respective fields. This proceedings volume is centered on the active research of the area but also includes an in-depth survey of one of the main topics, W-algebras.

Sojourns in Probability Theory and Statistical Physics - I Vladas Sidoravicius, 2019-10-17. Charles M. Chuck Newman has been a leader in Probability Theory and Statistical Physics for nearly half a century. This three-volume set is a celebration of the far-reaching scientific impact of his work. It consists of articles by Chuck's collaborators and colleagues across a number of the fields to which he has made contributions of fundamental significance. This publication was conceived during a conference in 2016 at NYU Shanghai that coincided with Chuck's 70th birthday. The sub-titles of the three volumes are: I. Spin Glasses and Statistical Mechanics; II. Brownian Web and Percolation; III. Interacting Particle Systems and Random Walks. The articles in these volumes, which cover a wide spectrum of topics, will be especially useful for graduate

students and researchers who seek initiation and inspiration in Probability Theory and Statistical Physics

Introduction to Superstrings and M-Theory Michio Kaku, 2012-12-06 Superstrings provocative controversial possibly untestable but unarguably one of the most interesting and active areas of research in current physics Called by some the theory of everything superstrings may solve a problem which has eluded physicists for the past 50 years the final unification of the two great theories of the twentieth century general relativity and quantum field theory Now here is a course tested comprehensive introductory graduate text on superstrings which stresses the most current areas of interest not covered in other presentation including string field theory multi loops Teichmueller spaces conformal field theory four dimensional strings The book begins with a simple discussion of point particle theory and uses the Feynman path integral technique to unify the presentation of superstrings Prerequisites are an acquaintance with quantum mechanics and relativity This second edition has been revised and updated throughout

An Introduction to Two-Dimensional Quantum Field Theory with (0,2) Supersymmetry Ilarion V. Melnikov, 2019-02-11 This book introduces two dimensional supersymmetric field theories with emphasis on both linear and non linear sigma models Complex differential geometry in connection with supersymmetry has played a key role in most developments of the last thirty years in quantum field theory and string theory Both structures introduce a great deal of rigidity compared to the more general categories of non supersymmetric theories and real differential geometry allowing for many general conceptual results and detailed quantitative predictions Two dimensional 0 2 supersymmetric quantum field theories provide a natural arena for the fruitful interplay between geometry and quantum field theory These theories play an important role in string theory and provide generalizations still to be explored fully of rich structures such as mirror symmetry They also have applications to non perturbative four dimensional physics for instance as descriptions of surface defects or low energy dynamics of solitonic strings in four dimensional supersymmetric theories The purpose of these lecture notes is to acquaint the reader with these fascinating theories assuming a background in conformal theory quantum field theory and differential geometry at the beginning graduate level In order to investigate the profound relations between structures from complex geometry and field theory the text begins with a thorough examination of the basic structures of 0 2 quantum field theory and conformal field theory Next a simple class of Lagrangian theories the 0 2 Landau Ginzburg models are discussed together with the resulting renormalization group flows dynamics and symmetries After a thorough introduction and examination of 0 2 non linear sigma models the text

introduces linear sigma models that in particular provide a unified treatment of non linear sigma models and Landau Ginzburg theories Many exercises along with discussions of relevant mathematical notions and important open problems in the field are included in the text Points, Lines, and Surfaces at Criticality Edoardo Lauria, 2019-07-30 This thesis offers a fascinating journey through various non perturbative aspects of Conformal Theories in particular focusing on the Conformal Bootstrap Programme and its extensions to theories with various degrees of symmetry Because of the preeminent role of Conformal Theories in Nature as well as the great generality of the results here obtained this analysis directly applies to many different areas of research The content of this thesis is certainly relevant for the physics community as a whole and this relevance is well motivated and discussed along the various chapters of this work The work is self contained and starts with an original introduction to conformal theories defects in such theories and how they lead to constraints on data and an extension of the bootstrap programme This situation is often realized by critical systems with impurities topological insulators or in the high energy context by Wilson and t Hooft operators The thesis continues with original research results of the author including supersymmetric extensions These results may be relevant non only in the high energy physics context where supersymmetry is required for the theory to be consistent but also for condensed matter systems that enjoy supersymmetry emergence at long distances *Non-perturbative Qft Methods And Their Applications, Procs Of The Johns Hopkins Workshop On Current Problems In Particle Theory 24* Zalan Horvath, Laszlo Palla, 2001-05-18 Contents Conformal Boundary Conditions and What They Teach Us V B Petkova J B Zuber A Physical Basis for the Entropy of the AdS3 Black Hole S Fernando F Mansouri Spinon Formulation of the Kondo Problem A Kl mper J R Reyes Martinez Boundary Integrable Quantum Field Theories P Dorey Finite Size Effects in Integrable Quantum Field Theories F Ravanini Nonperturbative Analysis of the Two Frequency Sine Gordon Model Z Bajnok et al Screening in Hot SU 2 Gauge Theory and Propagators in 3D Adjoint Higgs Model A Cucchieri et al Effective Average Action in Statistical Physics and Quantum Field Theory Ch Wetterich Phase Transitions in Non Hermitean Matrix Models and the Single Ring Theorem J Feinberg et al Unraveling the Mystery of Flavor A Falk The Nahm Transformation on $R^2 \times T^2$ C Ford A 2D Integrable Axion Model and Target Space Duality P Forg cs Supersymmetric Ward Identities and Chiral Symmetry Breaking in SUSY QED M L Walker and other papers Readership Theoretical mathematical and high energy physicists Keywords **Lectures on Tensor Categories and Modular**

Functors Bojko Bakalov, Alexander A. Kirillov, 2001 This book gives an exposition of the relations among the following three topics monoidal tensor categories such as a category of representations of a quantum group 3 dimensional topological quantum field theory and 2 dimensional modular functors which naturally arise in 2 dimensional conformal field theory The following examples are discussed in detail the category of representations of a quantum group at a root of unity and the Wess Zumino Witten modular functor The idea that these topics are related first appeared in the physics literature in the study of quantum field theory Pioneering works of Witten and Moore Seiberg triggered an avalanche of papers both physical and

mathematical exploring various aspects of these relations Upon preparing to lecture on the topic at MIT however the authors discovered that the existing literature was difficult and that there were gaps to fill The text is wholly expository and finely succinct It gathers results fills existing gaps and simplifies some proofs The book makes an important addition to the existing literature on the topic It would be suitable as a course text at the advanced graduate level *Symposium in Honor of C. H. Clemens* Aaron Bertram, James A. Carlson, Holger Kley, 2002 Gathers the 14 papers presented during a March 2000 symposium on algebraic geometry The contributors survey the links between geometry and the theory of Korteweg de Vries KdV equations as well as new developments in orbifold string theory Other papers investigate orthogonal complex hyperbolic arrangements vector bundles on the cubic threefold using symmetry to count rational curves the Nash conjecture for non projective threefolds and the punctual Hilbert scheme of a symplectic fourfold No index Annotation copyrighted by Book News Inc Portland OR
