

## Introduction to Pre – Calculus

Analytic Geometry is a unified algebra dealing with the study of relationships between different geometric figures and equations by means of the geometric properties and processes of algebra in relation to a coordinate system. This unit introduces the Four Types of Conic Sections namely the Circle, Parabola, Ellipse and Hyperbola.

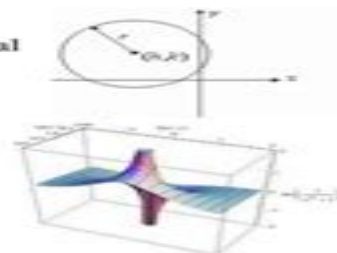

### Division of Analytic Geometry

#### 1. Plane Analytic Geometry

Deals with the study of points, curves and planes in a two-dimensional coordinate system

#### 2. Solid Analytic Geometry

Deals with the study of points, curves, surfaces and solid that is, in a three-dimensional coordinate system.

## An Overview of Conic Sections

We introduce the conic sections (or conics), a particular class of curves which oftentimes appear in nature and which have applications in other fields. One of the first shapes we learned, a circle, is a conic. When you throw a ball, the trajectory it takes is a parabola. The orbit taken by each planet around the sun is an ellipse. Properties of hyperbolas have been used in the design of certain telescopes and navigation systems.

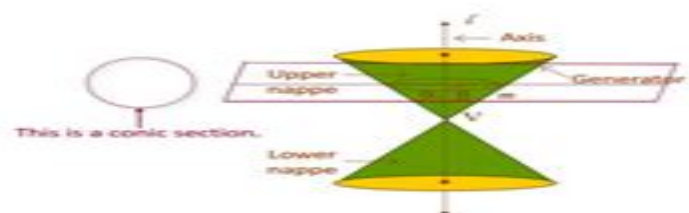

Figure 1: Parts of a Cone

Any figure that can be obtained by slicing a double cone is called a conic section. Depending on the angle of the plane with respect to the cone, a conic section may be a circle, an ellipse, a parabola, or a hyperbola.

- ❖ Circle - when the plane is horizontal
- ❖ Ellipse - when the (tilted) plane intersects
- ❖ Parabola - when the plane intersects only one cone to form an unbounded curve
- ❖ Hyperbola – when the plane (not necessarily vertical) intersects both cones to form two unbounded curves (each called a branch of the hyperbola)
