Hematologic malignancies HMs represent a group of hematologic cancers originating from bone marrow or lymphoid organs Currently leukaemia lymphoma and multiple myeloma are the most common HMs Conventional treatments for HMs include bone marrow transplantation radiotherapy chemotherapy and immunotherapy Despite the significant achievements obtained over the past decade in the drug therapy of HMs tumor metastasis and relapse in patients often occurred after an initial response indicating the generation of drug resistance to current therapies Moreover many clinically used therapeutic drugs are often associated with dose related side effects and a lack of specificity to tumor tissues The tumor microenvironment TME in HMs consists of a complicated network of cellular interactions and signaling cross talking within the bone marrow cavity and it plays an essential role in the progression and metastasis of HM Furthermore the TME in HMs has formed physiologic barriers such as immunosuppressive microenvironment upregulated anti apoptotic system drug resistance etc to facilitate drug resistance and relapse of HMs It has become widely accepted that effective treatment against HMs may require targeting both the cancer cell and TME
