

## M-Mode

In M-mode, soft tissue structure is shown as a scrolling display, with depth on the Y-axis and time on the X-axis. It is mostly used for cardiac measurements. M-mode is also known as T-M mode or Time-Motion mode. Ultrasound echoes of different intensities are mapped to different gray scale values in the display. M-mode displays time motion information derived from a stationary beam. M-mode is normally used in conjunction with a 2D (B-Mode) (B-Mode) image for spatial reference.

## Color Flow Doppler Mode

Color Doppler is used to detect motion presented as a two-dimensional display. There are three applications of this technique:

- **Color Flow Mode** - used to visualize blood flow velocity and direction.
- **Power Doppler (Angio)** - used to visualize the spatial distribution of blood.
- **Tissue Velocity Imaging** - The Tissue Color Doppler Imaging is used for color encoded evaluation of heart movements. Tissue Velocity Imaging images provide information about tissue motion direction and velocity.

Blood flow is displayed as a real-time two-dimensional cross-sectional image. The 2D (B-Mode) (B-Mode) cross-section is presented as a full color display, with various colors being used to represent blood flow (velocity, variance, power and/or direction).

To provide spatial orientation, the full color blood flow crosssection is overlaid on top of the gray scale cross-section of soft tissue structure (2D (B-Mode) (B-Mode) echo). Blood velocity is the primary parameter used to determine the display colors, but power and variance may also be used.

A high pass filter is used to remove the signals from stationary or slowly moving structures. Tissue motion is discriminated from blood flow by assuming that blood is moving faster than the surrounding tissue. Color flow can be used with 2D (B-Mode) (B-Mode) and Spectral Doppler modes.
