1.) The theory of color vision is based on the experimental observations that mixing the three additive primary colors of light can produce most other colors. What are the primary-additive colors of light?

Red, Green and Blue

1a) When beams of light of the additive primary colors are projected on top of each other, different colors of light are produced. This is called the additive method of color production.

a) What color of light does the person see when the three primary colors are turned on to 100%?

White

b) What color of light does the person see when the three primary colors are turned off?

Black

1c) The colors of light made by mixing two of the three additive primary colors in equal amounts are called the additive secondary colors. Use the simulation to determine the additive secondary color for each of the pairs of additive primary colors of light. For each case in the table below, the two additive colors must be set at 100% and the third color must be turned off.

Primary Color	Primary Color	Secondary Color
Red	Green	Yellow
Blue	Red	Magenta
Green	Blue	Cyan

1d) The colors you made above are the additive secondary colors. Now try to make the following colors by adjusting the amount of each additive primary color. This is done by moving the slider for each color up and down. Estimate the amount of each color as a percentage.

Color	Red Slider	Green Slider	Blue Slider
Light Pink	100 %	50 %	100 %
Purple	50	0	100
Orange	100	50	0
Red Pink	100	0	50
Gray	50	50	50
Teal	0	50	50
Brown	50	50	0
