

AUTOMATIC PISTOL

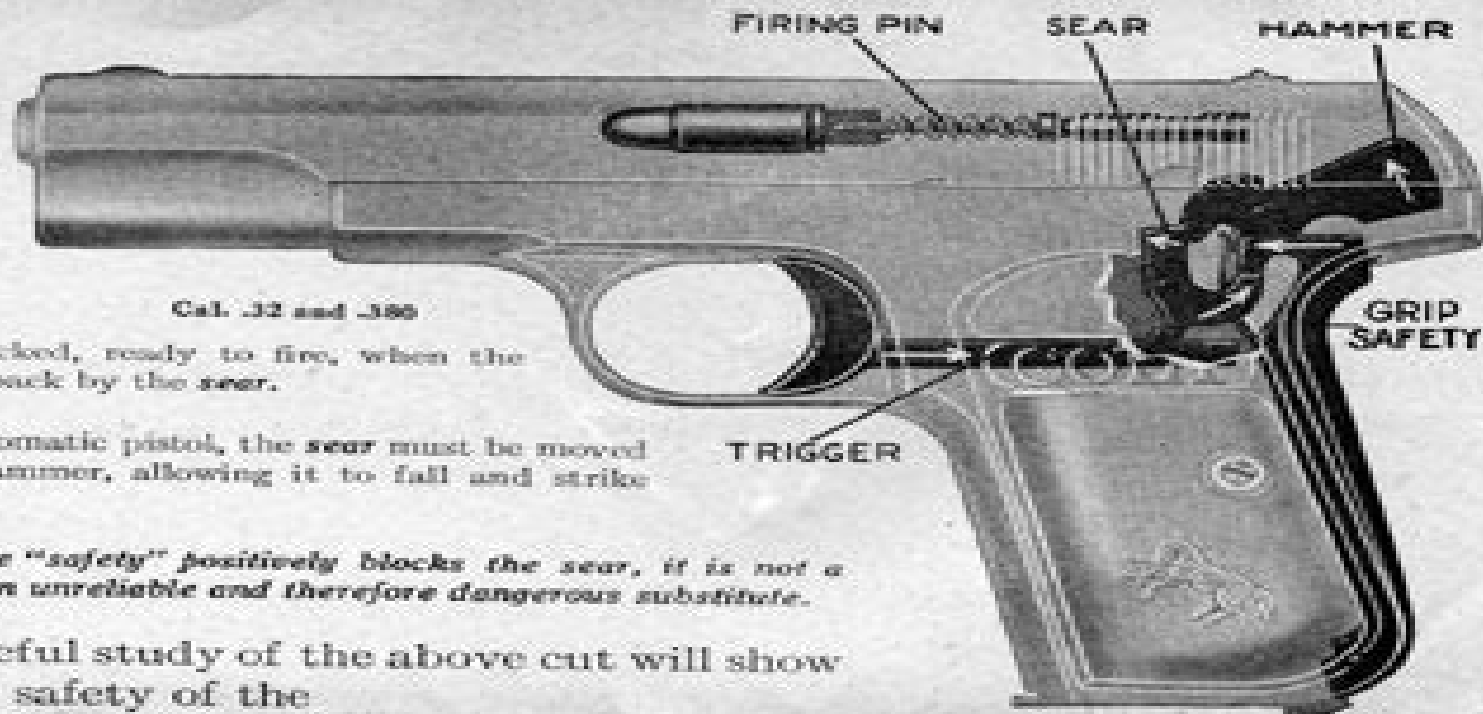

Cal. .32 and .380

A pistol is cocked, ready to fire, when the *hammer* is held back by the *sear*.

To fire an automatic pistol, the *sear* must be moved to release the hammer, allowing it to fall and strike the firing-pin.

Now unless the "safety" positively blocks the sear, it is not a real safety, but an unreliable and therefore dangerous substitute.

A little careful study of the above cut will show the absolute safety of the

COLT AUTOMATIC PISTOL.

The pistol is in "cocked" condition.

The front arm of the U-shaped sear engages the hammer notch; the lower point rests against end of trigger, and the short rear arm of the sear lies directly under the hooked end of the grip-safety.

Pulling the trigger will move the arms of the pivoted sear in two directions—the long arm moves to the front and out of the notch of the hammer, releasing the same, and the short arm moves upward. BUT, as the hooked end of the grip-safety lies directly above the short arm of the sear, it is easily seen that the sear is securely blocked until the grip-safety is pressed inward (to the front as indicated by arrow,) then the hooked end clears the short arm of the sear and permits it to move upward into the hollow in rear of the hook.

It will thus be plainly seen that a **COLT AUTOMATIC PISTOL** is *positively locked against accidental discharge.*
