

Chapter 46

Animal Reproduction

Two closely linked cycles characterize reproduction in human females.

- On reaching sexual maturity, human males carry out gametogenesis continuously, while human females produce gametes in cycles.
 - Ovulation occurs after the endometrium has started to thicken and develop a rich blood supply, preparing the uterus for the possible implantation of an embryo.
 - If pregnancy does not occur, the uterine lining is sloughed off, and another cycle begins.
 - The cyclic shedding of the endometrium from the uterus, which occurs in a flow through the cervix and vagina, is called **menstruation**.
- The **menstrual** or **uterine cycle** refers to the changes that occur in the uterus.
 - Menstrual cycles average 28 days (although cycles vary, ranging from 20 – 40 days).
- Cyclic events in the ovaries define the **ovarian cycle**.
- Hormone activity links the two cycles, resulting in the synchronization of ovarian follicle growth and ovulation with the establishment of a uterine lining that can support embryonic development.
- The reproductive cycle begins with the release from the hypothalamus of GnRH, which stimulates the pituitary to secrete small amounts of FSH and LH.
- FSH stimulates follicle growth, aided by LH, and the cells of the growing follicles start to make estradiol.
- There is a slow increase in the secretion of estradiol during the **follicular phase**, the part of the ovarian cycle in which follicles grow and oocytes mature.
 - Low levels of estradiol inhibit secretion of the pituitary hormones, keeping FSH and LH levels low.
- The secretion of estradiol by the growing follicle rises sharply, and levels of FSH and LH shoot up.
 - The high concentration of estradiol stimulates the secretion of gonadotropins by acting on the hypothalamus to increase its output of GnRH, stimulating the secretion of FSH and LH.
- LH secretion is especially high because the high concentration of estradiol increases the sensitivity of LH-releasing cells in the pituitary to GnRH.
 - Follicles also respond more strongly to LH at this stage because more of their cells have receptors for this hormone.
 - The increase in LH concentration caused by increased estradiol secretion from the growing follicle is a rare example of positive feedback.
- LH induces the final maturation of the follicle and ovulation, which takes place about a day after the LH surge.
 - The follicle and adjacent wall of the ovary rupture, releasing the secondary oocyte.
- Following ovulation, during the **luteal phase** of the ovarian cycle, LH stimulates the transformation of the follicle into the corpus luteum, a glandular structure.
- Under continued stimulation by LH, the corpus luteum secretes progesterone and estradiol.

Models of Seizures and Epilepsy Asla Pitkänen, Philip A. Schwartzkroin, Solomon L. Moshé, 2005-10-04 An understanding of mechanisms underlying seizure disorders depends critically on the insights provided by model systems. In particular with the development of cellular molecular and genetic investigative tools there has been an explosion of basic epilepsy research. Models of Seizures and Epilepsy brings together for the first time in 30 years an overview of the most widely used models of seizures and epilepsy. Chapters cover a broad range of experimental approaches from in vitro to whole animal preparations, a variety of epileptiform phenomenology including burst discharges and seizures and suggestions for model characterization and validation such as electrographic, morphologic, pharmacologic and behavioral features. Experts in the field provide not only technical reviews of these models but also conceptual critiques commenting on the strengths and limitations of these models, their relationship to clinical phenomenology and their value in developing a better understanding and treatments. Models of Seizures and Epilepsy is a valuable practical reference for investigators who are searching for the most appropriate laboratory models for addressing key questions in the field. It also provides an important background for physicians, fellows and students offering insight into the potential for advances in epilepsy research. The first comprehensive description of animal models of epilepsy since the early 1970's. Comprehensive analysis of what the models model to guide the selection of each model and what specific questions it will answer. Elegant examples of the use of novel technologies that can be applied in experimental epilepsy research. World expert opinions on the clinical relevance of each model.
