

Chapter 34

Care of Patients With Disorders of the Urinary System

The kidneys play a role in maintaining fluid balance, regulating the electrochemical composition of body fluids, providing protection against acid-base imbalance, forming red blood cells, regulating calcium levels, and eliminating waste products. The kidneys also help control blood pressure (BP), in conjunction with the endocrine system. **Circulatory disorders, metabolic disorders such as diabetes mellitus, immunologic disorders, obstruction, bacterial infections, or toxic substances can all cause kidney dysfunction.**

Inflammatory Disorders of the Urinary Tract (Cystitis)

Etiology and Pathophysiology

Cystitis is an inflammation of the urinary bladder. It is one of the most common urinary tract infections (UTIs) in women because the female urethra is shorter and the urinary meatus is exposed to contamination from the vagina and anus. The **Escherichia coli** bacterium normally resides in the intestinal tract as a nonpathogenic microorganism; it accounts for about 80% of all UTIs in females. **Cystitis and urethritis (inflammation of the urethra)** are common in women after they have become sexually active. **Honeymoon cystitis** is a term sometimes used to refer to bacteria that have entered the urethra by way of friction during intercourse. Urine that sits in the bladder (**urinary stasis**) provides a good medium for bacterial growth.

Signs, Symptoms, and Diagnosis

The most common symptoms of cystitis are painful urination, frequent and urgent urination, and low back pain. Confusion may be one of the first signs of cystitis or UTI in older adults.

Treatment and Nursing Management

First, specimens are collected for tests to identify the causative organism: urinalysis, urine culture and sensitivity, smear and Gram stain, or culture of the discharge.

- Antibiotics
- Topical estrogen and postmenopausal women
