

## Chapter 51: Animal Behavior

### 1. How is behavior defined?

An individual behavior is an action carried out by muscles under control of the nervous system in response to a stimulus.

### 2. What are ethology and behavioral ecology?

Ethology is the science of animal behavior or the study of human behavior and social organization from a biological perspective. Behavioral ecology is the study of the ecological and evolutionary basis for animal behavior.

### 3. What is the difference between proximate and ultimate causation?

Proximate causation asks how something occurs; ultimate causation asks why something occurs.

### 4. What is an example of a proximate causation and an ultimate causation question?

Tinbergen's questions, *If/that stimulus elicits the behavior, and what physiological mechanisms mediate the response?* and *How does the animal's experience during growth and development influence the response?* are examples of proximate causation ("how" a behavior occurs or is modified). His questions, *How does the behavior aid survival and reproduction?* and *What is the behavior's evolutionary history?* are examples of ultimate causation ("why" a behavior occurs in the context of natural selection).

### 5. Who are the three ethologists who shared a Nobel Prize for their work in 1973?

Nikola Tinbergen, Karl von Frisch and Konrad Lorenz earned a Nobel Prize in 1973.

### 6. What is a fixed action pattern (FAP)? Give an example.

The territorial response of male sticklebacks is an example of a fixed action pattern, a sequence of unlearned acts directly linked to a simple stimulus. Fixed action patterns are essentially unchangeable and, once initiated, usually carried to completion.

### 7. What is a sign stimulus?

The trigger for a FAP is an external cue called a sign stimulus, such as a red object prompting the male stickleback's aggressive behavior, or the color red provoking a bull.

### 8. Explain Nikolaus Tinbergen's work with the stickleback fish.

Male sticklebacks, which have red bellies, attack other males that invade their nesting territories. Tinbergen noticed that his male sticklebacks also behaved aggressively when a red truck passed in front of their tank. He carried out experiments showing that the red color of an intruder's underside is what provokes the attack behavior. A male stickleback will not attack a fish lacking red coloration, but will attack even unrealistic models if they contain areas of red color.

### 9. Define kinesis and taxis.

Kinesis is an undirected movement of an organism or part in response to an external stimulus. Taxis is a motion or orientation of an organism or part in response to an external stimulus.

### 10. Explain what is meant by a circadian clock and circadian rhythms.

A circadian clock is an internal mechanism that maintains a 24-hour activity rhythm or cycle. The output of the clock is a circadian rhythm, a daily cycle of rest and activity with far-reaching effects on behavioral physiology. The clock is normally synchronized with the light and dark cycles of the environment but can maintain rhythmic activity under constant environmental conditions, such as during hibernation.

### 11. Discuss two navigational strategies used by birds to migrate.
