### **Targeted Innovative Immunomodulation of Allergy and Inflammation by**

**Natural Molecules and Probiotics** Xiu-Min Li, Raj Tiwari ,Mingsan Miao,2025-03-03 Allergy is described as a global pandemic of non communicable inflammatory disease The World Allergy Organization estimates that 10 40% of the world s population is affected by allergic diseases Allergy manifests where the body confronts allergens in the environment such as nose or eyes resulting in allergic rhinitis skin resulting in dermatitis airways resulting in asthma and digestive system resulting in food allergy and eosinophilic esophagitis etc Food allergy FA increased drastically in the past 2 decades For example the estimated prevalence of food allergy is 10 % in the US 10 20% in UK 25% in Australia It estimates 200 400 million people may have food allergy globally Other allergic conditions also significantly increased These allergic conditions negatively affect quality of life in affected individuals and are potentially life threatening such as food induced anaphylactic shock and uncontrolled asthma Immunoglobulin E IgE is the central to the pathology of allergic diseases IgE binds to mast cells and basophils via high affinity receptors When these cells encounter specific allergens surface bound IgE is crosslinked and this triggers the cells to degranulate and release mediators such as histamine PAF and leukotrienes that cause symptoms such as hives swelling abdominal pain itching and respiratory distress and anaphylactic shock Eosinophils are the major inflammatory cells that involved in variety of allergic inflammatory conditions The mechanisms underlying the trend of allergy is largely unknown Current approaches to manage allergy include avoiding triggers using immune suppressing corticosteroids other medications such as antihistamine and allergen immunotherapy However long term use of some of the drugs may spark resistance and undesirable adverse effects There are no cures on the horizon Innovative approaches are needed Normally IgE producing B cells and plasma cells are minor populations with minimal IgE output compared with their counterparts such as IgG and IgA Dysregulation of these cells causes excessive and persistent IgE production which is the key for allergy becoming lifelong Despite decades of awareness about the centrality of allergen specific IgE in allergy inhibiting IgE production by B cells plasma cells remains a major challenge Omalizumab the anti IgE antibody traps IgE temporarily but does not tackle IgE production Oral immunotherapy OIT including Palforzia may paradoxically increase IgE levels 8 13 Therefore further research should focus on how to restore normality of IgE immune regulation which will alter the process of allergy leading to curative therapy Recent research demonstrated that in addition to the classical Th1 and Th2 paradigm B cell chemokines CXCL13 and plasma transcription factors XBP1 and Blimp1 contribute to persistent IgE production and to IgG1 cell conversion to IgE cells BCL6 has been demonstrated as an IgE transcriptional suppressor Furthermore in addition Th2 cell LC2 may also contribute to eosinophilic inflammation

**Strategies to be Competitive** Clara G. de los Reyes-Gavilán, Nuria Salazar, 2016-12-01 All parts of our body having communication with the external environment such as the skin vagina the respiratory tract or the gastrointestinal tract are colonized by a specific microbial community The colon is by far the most densely populated organ in the human body The pool of microbes inhabiting our body is known as microbiota and their collective genomes as microbiome These microbial ecosystems regulate important functions of the host and their functionality and the balance among the diverse microbial populations is essential for the maintenance of a healthy status The impressive development in recent years of next generation sequencing NGS methods have made possible to determine the gut microbiome composition This together with the application of other high throughput omic techniques and the use of gnotobiotic animals has greatly improved our knowledge of the microbiota acting as a whole In spite of this most members of the human microbiota are largely unknown and remain still uncultured The final functionality of the microbiota is depending not only on nutrient availability and environmental conditions but also on the interrelationships that the microorganisms inhabiting the same ecological niche are able to establish with their partners or with their potential competitors Therefore in such a competitive environment microorganisms have had to develop strategies allowing them to cope adapt or cooperate with their neighbors which may imply notable changes at metabolic physiological and genetic level The main aim of this Research Topic was to contribute to better understanding complex interactions among microorganisms residing in human microbial habitats
