Free Flight United States. Congress. House. Committee on Government Operations. Employment, Housing, and Aviation Subcommittee, 1997 *Free Flight* James Fallows, 2002-09-05 A technological revolution Fallows explains is underway that will relieve the problems currently facing the airline industry Featuring stories of three groups who are inventing and building the future of all air travel the author explains that the current overloaded hub system will be replaced by a new environment of air travel This edition features a new preface by the author **National Airspace System free flight tools show promise, but implementation challenges remain.** ,2001 To help meet the growing demand for air travel the Federal Aviation Administration FAA in collaboration with the aviation community is implementing a new approach for air traffic management known as free flight Under this approach FAA is moving gradually from its present use of highly structured rules and procedures for air traffic operations to a more flexible approach which increases collaboration between FAA and the aviation community By using a set of new automated technologies tools and procedures free flight is intended to increase the capacity and efficiency of our nation s airspace system while helping to minimize delays Two of these tools the Traffic Management Advisor and the passive Final Approach Spacing Tool provide controllers with a more efficient and effective means to increase the capacity of our nation s airspace system by better scheduling sequencing spacing and assigning aircraft to runways These two tools are expected to allow more aircraft to land during peak periods of traffic thus increasing capacity and minimizing delays Another tool the User Request Evaluation Tool allows controllers to make more efficient use of the existing airspace by allowing aircraft to fly optimal or more direct routes thus helping to reduce delays at major airports Collectively these tools are also designed to achieve the above benefits without negatively affecting safety

National Airspace System : FAA has implemented some free flight initiatives, but challenges remain : report to Congressional requesters United States. General Accounting Office, 1998 Free-flight Investigation of the Deployment, Dynamic Stability, and Control Characteristics of a 1/12-scale Dynamic Radio-controlled Model of a Large Booster and Parawing Sanger M. Burk, 1963 An investigation has been conducted to determine the deployment dynamic stability and control characteristics of a parawing rocket booster model using a radio controlled free flight technique The parawing utilized folded rigid members The results show that this deployment technique provides consistent transitions from essentially vertical descent at subsonic speeds with the parawing stowed on the booster to normal trimmed gliding flight with the parawing deployed For the particular deployment configuration selected a small drogue parachute was needed to hold the parawing away from the booster during deployment until the parawing was developing lift properly In general the flight characteristics of the model were fairly satisfactory for an unmanned vehicle although the model had a small constant amplitude Dutch roll oscillation and some undesirable characteristics at the stall The model was controllable by center of gravity movement but the response of the model appeared to be sluggish Results of a Free-flight Test to Determine the

Performance Characteristics of a Towed, Conical Decelerator J. W. Usry, 1969 An inflatable fabric decelerator was tested in free flight to determine its drag and stability characteristics The inflated decelerator approximated an 80 cone with a 48 inch 121 9 base and was towed behind a cone cylinder flare payload at a distance of 13 6 feet 4 15 m from payload base **A Computer Program for Systematically Analyzing Free-flight Data to Determine the Aerodynamics of Axisymmetric Bodies** Gerald N. Malcolm, Gary T. Chapman, 1968 Hypersonic Free Flight Research: Instrumentation evaluation and data analysis, by R. W. Bogle and R. J. Magnus Robert Worthington Bogle, Aerospace Research Laboratories (U.S.), 1960

Determination of Longitudinal Stability and Control Characteristics from Free-flight Model Tests with Results at Transonic Speeds for Three Airplane Configurations Clarence L. Gills, David Adamson, G. Chester Furlong, Harold Mirels, Henry A. Cole, I. Irving Pinkel, J. Howard Childs, Robert M. Reynolds, Robert T. Jones, United States. National Advisory Committee for Aeronautics, Edmund G. Rosenberg, James G. McHugh, Jesse L. Mitchell, Robert I. Sammonds, Thaine W. Reynolds, W. E. Bond, William B. Boatright, Charles C. Graves, John H. Walker, M. A. Kissel, 1957 *Boundary-layer Transition Experiments on Sharp, Slender Cones in Supersonic Freeflight* Daniel C. Reda, 1977 **Free-flight Measurements of the Static and Dynamic Stability and Drag of a 10 Degree Blunted Cone at Mach Numbers 3.5 and 8.5** Peter F. Intrieri, 1962 **A Technique for Determining Relaxation Times by Free-flight Tests of Low-fineness-ratio Cones; with Experimental Results for Air at Equilibrium Temperatures Up to 3440 K** Jack D. Stephenson, 1960 This report describes a technique which combines theory and experiments for determining relaxation times in gases The technique is based on the measurement of shapes of the bow shock waves of low fineness ratio cones fired from high velocity guns The theory presented in the report provides a means by which shadowgraph data showing the bow waves can be analyzed so as to furnish effective relaxation times Relaxation times in air were obtained by this technique and the results have been compared with values estimated from shock tube measurements in pure oxygen and nitrogen The tests were made at velocities ranging from 4600 to 12 000 feet per second corresponding to equilibrium temperatures from 35900 R 19900 K to 6200 R 34400 K under which conditions at all but the highest temperatures the effective relaxation times were determined primarily by the relaxation time for oxygen and nitrogen vibrations

On the Free Flight Drag Determination of a Finned Configuration (RM-10) Flying at Critical Reynolds Numbers John D. Nicolaides, 1953 Free-flight Investigation of the Deployment of a Parawing Recovery Device for a Radio-controlled 1/5-scale Dynamic Model Spacecraft Charles E. Libby, 1963 A free flight investigation of a radio controlled model of a manned reentry spacecraft with a telescoping rigid parawing as a recovery system was made to evaluate the deployment process and the stability and control characteristics of the configuration Flight tests showed that the parawing could be deployed from a packaged condition but that the deployment process must be a sequence of carefully controlled and timed events and that some portions of the deployment should not occur at too fast a rate The most significant single factor learned about the deployment process was

that the parawing had to be slowly rotated to a lifting condition Transition which is too fast from zero lift to maximum lift would result in a tumbling motion After the parawing was deployed the configuration was stable and controllable

Determination of Lateral Stability Characteristics from Free-flight Model Tests, with Experimental Results on the Effects of Wing Vertical Position and Dihedral at Transonic Speeds Clarence L. Gillis, Jesse L. Mitchell, Charles T. D'Aiutolo, 1960 A test and analysis method is presented for determining airplane lateral stability characteristics including aerodynamic derivatives from flight tests of scale models The method of analysis utilizes the rotating time vector concept and also a quasi static approach Data are presented at transonic speeds for three swept wing rocket propelled models differing only in vertical position and dihedral of the wing The method proved to be adequate for delineating the major effects of the geometric variations on the aerodynamic lateral stability derivatives The effects of Reynolds number on the linearity of the static stability data for an unswept wing configuration are illustrated Preliminary Results for a Free-flight Investigation at Transonic and Supersonic Speeds of Longitudinal Stability and Control Characteristics of an Airplane Configuration with a Thin Straight Wing of Aspect Ratio 3 Clarence L. Gillis, Robert F. Peck, A. James Vitale, 1950 **Free Flight Hypersonic Heat Transfer and Boundary Layer Transition Studies** James E. Brunk, Warren N. White, 1961 Two HTV 1 Hypersonic Test Vehicles Rounds A 40 and A 41 were flown at Holloman AFB in October 1959 with blunted and sharp 20 degree half angle nose cones respectively Round A 40 also incorporated nose cone incidence and a pitch disturber rocket A maximum flight velocity of 5800 feet per second was attained corresponding to a local shape cone Mach number and unit Reynolds number of 3.4 and 50×10^6 per foot respectively Flight dynamics data for the second stage of Round A 40 were obtained from analyses of the vector angle of attack history The measured maximum trim angle of attack 1.5 degrees agreed closely with the predicted trim based on an elastic structure and a nose cone incidence of 0.36 degrees Surface temperatures and aerodynamic heating rates were obtained for one station and three radial positions on the conical portion of the blunted nose cone Round A 40 and at 3 stations on each of the two longitudinal rays on the sharp cone Round A 41 In addition the temperature and heating rates were determined on the cylindrical portion of the Round A 41 payload and on the base of on Stage II fin for both vehicles The maximum heating rate for the sharp cone was about 30 percent greater for the blunt cone as a result of higher local Mach numbers and Reynolds numbers on the sharp cone Correlation of the blunted cone circumferential heating rates with the measured angle of attack showed that only a small increase in heating rate less than about 5 percent increase from the zero angle of attack heating rate occurs on the windward ray for turbulent heating conditions The measured decrease in Stanton number with increasing Reynolds number running length for the sharp cone was found to be in close agreement with turbulent flow theory Boundary layer transition reversal from turbulent to laminar flow was experienced on both the sharp and blunted tip cones Transition reversal for the sharp cone which had almost twice the local Mach number of the blunted cone was found to occur at an enthalpy ratio h_w/h_r 30 percent greater than for the

blunted cone For both cones turbulent flow occurred within the Mach number and enthalpy region for complete stability of two dimensional disturbance as defined by Dunn and Lin The possible effects of surface roughness in producing the observed transition reversal are discussed

Barr,1988-01-01 Two leading experts introduce beginners to basic aerodynamic principles and the building techniques of master modelers Their richly illustrated manual provides valuable information on every phase of assembling and flying model aircraft from the correct methods of kit building and paint and tissue covering to the secrets of selecting the best engine and radio control rig for each plane

Free Flight Free Flight Book Review: Unveiling the Magic of Language

In an electronic era where connections and knowledge reign supreme, the enchanting power of language has are more apparent than ever. Its ability to stir emotions, provoke thought, and instigate transformation is truly remarkable. This extraordinary book, aptly titled "**Free Flight Free Flight**," published by a very acclaimed author, immerses readers in a captivating exploration of the significance of language and its profound affect our existence. Throughout this critique, we shall delve in to the book is central themes, evaluate its unique writing style, and assess its overall influence on its readership.
