Modelling And Planning For Sensor Based Intelligent Robot Systems Horst Bunke, Hartmut Noltemeier, Takeo Kanade, 1995-10-24 This edited and reviewed volume consists of papers that were originally presented at a workshop in the Scientific Center at Schloss Dagstuhl Germany It gives an overview of the field and presents the latest developments in the areas of modeling and planning for sensor based robots The particular topics addressed include active vision sensor fusion environment modeling motion planning robot navigation distributed control architectures reactive behavior and others

Computational Methods for Algebraic Spline Surfaces Tor Dokken, Bert Jüttler, 2006-05-24 This volume contains revised papers that were presented at the international workshop entitled Computational Methods for Algebraic Spline Surfaces COMPASS which was held from September 29 to October 3 2003 at Schlo Weinberg Kefermarkt Austria The workshop was mainly devoted to approximate algebraic geometry and its applications The organizers wanted to emphasize the novel idea of approximate implicitization that has strengthened the existing link between CAD CAGD Computer Aided Geometric Design and classical algebraic geometry The existing methods for exact implicitization i e for conversion from the parametric to an implicit representation of a curve or surface require exact arithmetic and are too slow and too expensive for industrial use Thus the duality of an implicit representation and a parametric representation is only used for low degree algebraic surfaces such as planes spheres cylinders cones and toroidal surfaces On the other hand this duality is a very useful tool for developing efficient algorithms Approximate implicitization makes this duality available for general curves and surfaces The traditional exact implicitization

of parametric surfaces produce global representations which are exact everywhere. The surface patches used in CAD however are always defined within a small box only; they are obtained for a bounded parameter domain, typically a rectangle or in the case of trimmed surface patches a subset of a rectangle. Consequently, a globally exact representation is not really needed in practice. Computational Science — ICCS 2002 Peter M.A. Sloot, C.J. Kenneth Tan, Jack J. Dongarra, Alfons G.

Hoekstra, 2003-08-01 Computational Science is the scientific discipline that aims at the development and understanding of new computational methods and techniques to model and simulate complex systems. The area of application includes natural systems such as biology, environmental and geo-sciences, physics and chemistry, and synthetic systems such as electronics and financial and economic systems. The discipline is a bridge between classical computer science, logic, complexity, architecture, algorithms, mathematics, and the use of computers in the aforementioned areas. The relevance for society stems from the numerous challenges that exist in the various science and engineering disciplines which can be tackled by advances made in this field. For instance, new models and methods to study environmental issues like the quality of air, water, and soil, and weather and climate predictions through simulations, as well as the simulation-supported development of cars, airplanes, and medical and transport systems, etc. Paraphrasing R. Kenway: R.D. Kenway, *Contemporary Physics*, 1994. There is an important message to scientists, politicians, and industrialists: in the future, science, the best industrial design and manufacture, the greatest medical progress, and the most accurate environmental monitoring and forecasting will be done by countries that most rapidly exploit the full potential of computational science. Nowadays, we have access to high-end computer architectures and a large range of computing environments, mainly as a consequence of the enormous stimulus from the various international programs on advanced computing, e.g. *An Isogeometric Approach to Beam Structures* Buntara S.

Gan, 2017-06-01 This book proposes a novel original condensation method to beam formulation based on the isogeometric approach to reducing the degrees of freedom to conventional two-node beam elements. In this volume, the author defines the Buntara Condensation Formulation, a unique formulation in condensing the dynamic equilibrium equation for beam structures suitable for reducing the number of unlimited dynamic equations necessary to yield a classic two-node beam element. Professor Buntara's method overcomes the problem of the isogeometric approach where the number of degrees of freedom is increased along with the complexity of the geometrical beam element and facilitates implementation of the codes into the existing beam structures programs and CAD geometrical data into the conventional FE beam element codes. The book proposes a new reduction method where the beam element can be treated as under the conventional beam element theory that has only two nodes at both ends. Approximation and Modeling with B-Splines Klaus Hollig, Jorg

Horner, 2015-07-01 B-splines are fundamental to approximation and data fitting, geometric modeling, automated manufacturing, computer graphics, and numerical simulation. With an emphasis on key results and methods that are most widely used in practice, this textbook provides a unified introduction to the basic components of B-spline theory.

Computer-Aided Geometric Design Fujio Yamaguchi, 2011-06-28 Computer graphics computer aided design and computer aided manufacturing are tools that have become indispensable to a wide array of activities in contemporary society Euclidean processing provides the basis for these computer aided design systems although it contains elements that inevitably lead to an inaccurate non robust and complex system The primary cause of the deficiencies of Euclidean processing is the division operation which becomes necessary if an n space problem is to be processed in n space The difficulties that accompany the division operation may be avoided if processing is conducted entirely in $n-1$ space The paradigm attained through the logical extension of this approach totally four dimensional processing is the subject of this book This book offers a new system of geometric processing techniques that attain accurate robust and compact computations and allow the construction of a systematically structured CAD system
