Crop Stress And Its Management Perspectives And Strategies:

Crop Stress and its Management: Perspectives and Strategies B. Venkateswarlu, Arun K. Shanker, Chitra Shanker, M. Maheswari, 2011-11-22 Crops experience an assortment of environmental stresses which include abiotic viz drought water logging salinity extremes of temperature high variability in radiation subtle but perceptible changes in atmospheric gases and biotic viz insects birds other pests weeds pathogens viruses and other microbes The ability to tolerate or adapt and overwinter by effectively countering these stresses is a very multifaceted phenomenon In addition the inability to do so which renders the crops susceptible is again the result of various exogenous and endogenous interactions in the ecosystem Both biotic and abiotic stresses occur at various stages of plant development and frequently more than one stress concurrently affects the crop Stresses result in both universal and definite effects on plant growth and development One of the imposing tasks for the crop researchers globally is to distinguish and to diminish effects of these stress factors on the performance of crop plants especially with respect to yield and quality of harvested products This is of special significance in view of the impending climate change with complex consequences for economically profitable and ecologically and environmentally sound global agriculture The challenge at the hands of the crop scientist in such a scenario is to promote a competitive and multifunctional agriculture leading to the production of highly nourishing healthy and secure food and animal feed as well as raw materials for a wide variety of industrial applications In order to successfully meet this challenge researchers have to understand the various aspects of these stresses in view of the current development from molecules to ecosystems The book will focus on broad research areas in relation to these stresses which are in the forefront in contemporary crop stress research

Khan,Naser A. Anjum,Adriano Sofo,Rene Kizek,Margarete Baier,2016-06-30 The production of cellular oxidants such as reactive oxygen species ROS is an inevitable consequence of

redox cascades of aerobic metabolism in plants This milieu is further aggravated by a myriad of adverse environmental conditions that plants owing to their sessile life style have to cope with during their life cycle Adverse conditions prevent plants reaching their full genetic potential in terms of growth and productivity mainly as a result of accelerated ROS generation accrued redox imbalances and halted cellular metabolism In order to sustain ROS accrued consequences plants tend to manage a fine homeostasis between the generation and antioxidants mediated metabolisms of ROS and its reaction products Well known for their involvement in the regulation of several non stress related processes redox related components such as proteinaceous thiol members such as thioredoxin glutaredoxin and peroxiredoxin proteins and key soluble redox compounds namely ascorbate AsA and glutathione GSH are also listed as efficient managers of cellular redox homeostasis in plants The management of the cellular redox homeostasis is also contributed by electron carriers and energy metabolism mediators such as non phosphorylated NAD and the phosphorylated NADP coenzyme forms and their redox couples DHA AsA GSSG GSH NAD NADH and NADP NADPH Moreover intracellular concentrations of these cellular redox homeostasis managers in plant cells fluctuate with the external environments and mediate dynamic signaling in plant stress responses This research topic aims to exemplify new information on how redox homeostasis managers are modulated by environmental cues and what potential strategies are useful for improving cellular concentrations of major redox homeostasis managers Additionally it also aims to provide readers detailed updates on specific topics and to highlight so far unexplored aspects in the current context

Investment planning to minimize climate risk in agricultural production: An optimization model for a semi-arid region in India Deb Pal, Barun, Kumar, Shalander, Patan, Elias Khan, 2020-12-12 The primary aim of this study is to prioritize investment required for scaling up climate smart agriculture CSA technologies across different districts of Telangana state which is in the semi arid region of India First we analysed the trade offs between expected agricultural income and its deviation across districts under drought and normal weather scenarios The conventional MOTAD model was extended with various climate smart technologies to assess their role in minimizing the trade offs under various weather scenarios A district level panel dataset on cost of cultivation and crop production for 11 major crops under six different climate smart technologies and farmers practices for

five years 2010 11 to 2014 15 has been used The dataset comprised a collation of official statistics on cost of cultivation focus group interviews with farmers over the years and data from experimental plots of Regional Agricultural Research Stations The analysis reveals that the adoption of CSA technologies is likely to reduce production risk by 16% compared to farmers traditional practices FTPs while achieving optimum levels of crop income Under a scenario of higher probability of drought production risk is likely to increase by 12% in the state under FTPs the adoption of CSA technologies could reduce the risk by 25% The study suggests increasing investments in farm ponds and un puddled machine transplanting in rice to minimize the risk return trade offs under a higher drought frequency scenario Finally the study generates evidence for policymakers to make informed investment decisions on CSA in order to enhance farming system resilience across districts in the semi arid state of Telangana India

Metals and Metalloids in Plant Signaling Tariq Aftab,2024-06-28 In many parts of the world soil and water are slightly to moderately contaminated with metals and metalloids such as Cd Cu Zn Ni Co Cr Pb Si B and As This could be due to long term use of phosphatic fertilizers sewage sludge application dust from smelters industrial waste and bad watering practices in agricultural lands Beside natural factors human activities have contributed to the enormous increase in heavy metal and or metalloid pollution in the environment Metal and metalloid stress are major abiotic stress factors that limit crop production and reduce agricultural yield The primary response of plants is the generation of reactive oxygen species ROS upon exposure to high levels of metals metalloids They either generate ROS directly through Haber Weiss reactions or overproduction of ROS and occurrence of oxidative stress in plants could be the indirect consequence of metals metalloids toxicity The indirect mechanisms include their interaction with the antioxidant system disrupting the electron transport chain or disturbing the metabolism of essential elements One of the most deleterious effects induced by heavy metals exposure in plants is lipid peroxidation which can directly cause biomembrane deterioration The impact of metals metalloids on plant water relations has to be distinguished from their effects on water availability in soils on root growth limiting water uptake as well as other phytotoxic effects If soils are high in soluble salts including heavy metal salts the osmotic potential in the soil solution might be lower than the potential of the cell sap in root Under these circumstances the soil solution would severely restrict the rate of water uptake by plants and lead to osmotic stress Further the negative influence metals metalloids have on the growth and activities of soil microorganisms may also indirectly affect the growth of plants In the book **Metals and Metalloids in Plant Signaling** we elucidated the effects of metals metalloids on signaling and communication cascades in plants The general aim of the present book is to provide a comprehensive analysis of the current situation and development in the field and to develop a science based theoretical foundation for the conceptualization and practical application The various chapters are based on the consideration of metals metalloids in terms of their action on different regulatory and functional systems of plants signaling metabolism uptake and transport mechanisms etc
