Introduction:

- 1. What are the major changes that occurred about 4.5 billion years after the formation of Earth?
Forming of Earth - differentiation - cooling - formation of atmosphere - formation of oceans
- 2. What are the major types of evidence that support the formation of Earth?
Planetary formation - meteorites - planetary differentiation - Earth's composition - isotopes
- 3. How do scientists know the composition of the early Earth?
Isotopic analysis of meteorites - planetary differentiation - Earth's composition
- 4. What is the evidence that supports the formation of the Moon?
The Giant Impact Hypothesis

1. The formation of Earth is a complex process that involves the accretion of dust and gas in the protoplanetary disk around the Sun. The process begins with the formation of the solar nebula, a cloud of gas and dust that collapses under its own gravity to form a protostar. As the protostar grows, it attracts more material, forming a disk of gas and dust around it. The disk is the source of the material that will eventually form the planets.

2. The formation of Earth is supported by several lines of evidence. One of the most important is the study of meteorites, which are fragments of rock from other planets or asteroids. Meteorites provide a record of the composition of the early solar system, and their study has helped scientists understand the processes that shaped the Earth. Other evidence includes the study of the Earth's composition, which shows that it is made of the same materials as the other planets in the solar system.

3. Scientists know the composition of the early Earth by studying meteorites and the Earth's composition. Meteorites are fragments of rock from other planets or asteroids, and they provide a record of the composition of the early solar system. The Earth's composition is also studied, and it is found that the Earth is made of the same materials as the other planets in the solar system. This suggests that the Earth formed from the same material as the other planets.

4. The formation of the Moon is supported by several lines of evidence. One of the most important is the study of the Moon's composition, which shows that it is made of the same materials as the Earth. This suggests that the Moon formed from the same material as the Earth. Other evidence includes the study of the Moon's surface, which shows that it is covered in craters and has a thin atmosphere. This suggests that the Moon is a relatively young body in the solar system.

5. The formation of the Moon is supported by several lines of evidence. One of the most important is the study of the Moon's composition, which shows that it is made of the same materials as the Earth. This suggests that the Moon formed from the same material as the Earth. Other evidence includes the study of the Moon's surface, which shows that it is covered in craters and has a thin atmosphere. This suggests that the Moon is a relatively young body in the solar system.
