

Soil Correlations

This section of the Geotechnical Manual presents the SPT correlations to be used for friction angle (phi angle) and unit weight. The correlations use Standard Penetration Test (N) values corrected for overburden and hammer efficiency (N_{160}). Usage of correlations for geotechnical design is addressed in the various design sections of the Geotechnical Manual. Other correlations, e.g., CPT correlations and shear wave velocity correlations are found elsewhere in the Geotechnical Manual.

Cohesionless Soil: Friction Angle

Correlations of SPT blow counts to cohesionless soil friction angle and unit weight follow Bowles (1977) and are consistent with many of the text manuals used by the department. The correlations use Standard Penetration Test (N) values corrected for overburden and hammer efficiency (N_{160}).

Use Chart 1 to correlate N_{160} to the friction (phi) angle.

Choose the friction angle (expressed to the nearest degree) based upon the soil type, particle sizes, and rounding or angularity. Experience should be used to select specific values within the ranges. In general, finer materials or materials with significant (about 50%+) silty/sand material will fall in the lower portion of the range. Coarser materials
