**Rice Production in Cambodia** Harry J. Nesbitt, 1997 Rice in the Cambodian economy past and present Topography climate and rice production Soils and rice Rice based farming systems Rice ecosystems and varieties Pest management in rice Farm mechanization Capture and culture ricefield fisheries in Cambodia Constraints to rice production and strategies for improvement Rice Cultivation in Cambodia Richard P. Lando, 1991 Rice production responses in Cambodia Bingxin Yu, Shenggen Fan, *Improving Rice Production and Commercialization in Cambodia* Asian Development Bank, 2014-09-01 Cambodia has a potential advantage in agricultural production due to significant amounts of fertile land and high levels of agricultural employment but rice production and commercialization remain well below potential This study uses a farm investment climate assessment to provide evidence on key areas where government investments and policy reforms can lead to higher levels of rice production and commercialization in small farms Improving output markets through domestic milling and increasing the area irrigated are found to be related to increased production efficiency commercialization rice sold and value of sales **Adoption of Productivity-Enhancing Inputs and Improved Farm Practices in Cambodia's Rice Production** Socheat Keo, 2018 **Rice Production in Tonle Sap Floodplains in Response to Anthropogenic Changes in Hydrology, Climate, and Agronomic Practices** Manuel Paderan Marcaida (III), 2020 Rice is the most important agricultural commodity in Cambodia as food and source of livelihood Majority of rice production happens around the Tonle Sap floodplains sustained by the sediment rich flood from the Mekong River With the increased construction of hydropower dams upstream the natural flow of water organic materials and fish species delivered to the Tonle Sap Lake is altered While these changes open up more areas for rice cultivation especially during the dry season the quality of the sediments is expected to decline Moreover drought is becoming a frequent occurrence and temperature is increasing This study examined how the rice cultivation in the Tonle Sap floodplains is impacted by the hydrological changes climate and agronomic practices Specifically we 1 assessed the impacts of the increasing presence of dams on the timing and location of rice cropping and 2 tested and applied an ecophysiological crop model to simulate the effect of changes in hydrology agronomic practices and increasing temperature on rice production in Tonle Sap floodplains Spatio temporal effect of dams in rice production was identified following the PhenoRice algorithm focusing on two rice growing provinces Kampong Thom and Battambang using time series satellite images from 2001 to 2019 Yield simulations to determine the effect of hydrology agronomic practices and increasing temperatures were executed in ORYZA v3 Rice Model validated by actual field measurements and personal interviews with farmers The model estimated the total production per planting time and yield responses to varying soil organic carbon content N application and temperature PhenoRice results showed that the rice cultivation increased with lake extent during dry season In addition location and the timing of crop establishment were adjusted depending on the availability of floodwater The identified rice areas from PhenorRice were used to estimate the

total production in ORYZA v3 as influenced by changing climate and hydrology The rice model predicted that the yield penalty with decreasing soil organic carbon was greater than the yield gained from increasing it We determined the optimum N required and efficient timing of applications to get the maximum attainable yield The model also showed that increasing temperature decreases yield but drastic loss occurred when temperature was increased by more than 2 C This study provides information on how hydrology climate and agronomic practices impact rice production in Cambodia that are vital for making important decisions related to water management and food security in the Lower Mekong Region

*White Gold: The Commercialisation of Rice Farming in the Lower Mekong Basin* Rob Cramb, 2020-01-03 This open access book is about understanding the processes involved in the transformation of smallholder rice farming in the Lower Mekong Basin from a low yielding subsistence activity to one producing the surpluses needed for national self sufficiency and a high value export industry For centuries farmers in the Basin have regarded rice as white gold reflecting its centrality to their food security and well being In the past four decades rice has also become a commercial crop of great importance to Mekong farmers augmenting but not replacing its role in securing their subsistence This book is based on collaborative research to a compare the current situation and trajectories of rice farmers within and between different regions of the Lower Mekong b explore the value chains linking rice farmers with new technologies and input and output markets within and across national borders and c understand the changing role of government policies in facilitating the on going evolution of commercial rice farming An introductory section places the research in geographical and historical context Four major sections deal in turn with studies of rice farming value chains and policies in Northeast Thailand Central Laos Southeastern Cambodia and the Mekong Delta The final section examines the implications for rice policy in the region as a whole

**Agriculture, irrigation and poverty reduction in Cambodia** de Silva, S.[Author]; Johnston, R.[Author]; Senaratna Sellamuttu, S.[Author], This report is a contribution to an assessment of the current status of agriculture in Cambodia focusing on the linkages between agriculture and water mainly in the form of irrigation It seeks to view current government policies on agriculture and irrigation in the context of experiences on the ground as communicated through the many field studies that cover varied aspects of performance in the agriculture sector and irrigation schemes In an effort to identify future research areas this review examines the status quo and connects or disconnects with stated policy through a broad lens to capture strengths and challenges across crop production irrigation management and post harvest contexts It places irrigation under scrutiny in terms of its value as a major area of government expenditure in recent years and asks whether it presents the best potential for future gains in productivity when compared with the prospects offered by investments in other aspects of agriculture The fieldwork and review of current literature that form the basis of this report were undertaken at the request of and partly funded by the Australian Centre for International Agricultural Research ACIAR It is also intended to contribute knowledge to the CGIAR Research Program on Aquatic

Agricultural Systems AAS led by WorldFish who co funded the activities      *Cambodian Agriculture* Timothy S. Thomas, Tin Ponlok, Ros Bansok, Thanakvaro De Lopez, Cathy Chiang, Nang Phirun, Chhim Chhun, 2013-08-22 Cambodia has been identified as one of the most vulnerable countries to climate change given the predicted changes in temperature and precipitation the share of labor in agriculture and the country's low adaptive capacity due to widespread poverty In this study we use climate data from four general circulation models GCMs to evaluate the impact of climate change on agriculture in Cambodia by 2050 We used the Decision Support System for Agrotechnology Transfer crop modeling software to evaluate crop yields first for the 1950 2000 period actual climate and then for the climates given by the four GCMs for 2050 We evaluated crop yields for eight different crops at 2 162 points in Cambodia using a grid of 10 kilometer squares for 2000 and 2050 For each crop we searched for the best cultivar variety in each square rather than assuming the same cultivar to be used in all locations We also searched for the best planting month in each square We explored potential gains from changing fertilizer levels and from using irrigation to compensate for rainfall changes This analysis indicates that when practiced together using improved cultivars better suited for the changing climate conditions and adjusting planting dates can lessen the impact of climate change on yields including for both wet and dry season rice In addition the analysis shows that losses in yield due to climate change can be compensated for for many crops by increasing the availability of nitrogen in the soil To provide context to the modeling analysis a survey of 45 communes was conducted using focus group discussions to solicit information on agricultural practices Questions were asked about fertilizer irrigation seeds tillage and pest management as well as about natural disasters and how farmers respond Key results indicate that in response to extreme weather only 7 to 16 percent of farmers report changing crop variety and only 20 percent of farmers report changing planting dates Since the modeling results indicate that adaptation to climate change by changing crop variety and planting dates will be critical in order to avoid yield losses over the next 40 years it is recommended that farmers expand their capacity to adapt in this way In addition every commune reported using some type of chemical fertilizer however in a typical commune only 50 percent of the farmers were using any chemical fertilizer This indicates that there is room to increase the use of chemical fertilizers Finally focus group participants were asked to name the top three natural disasters of concern Drought was the most cited reported in 44 of the 45 communes 98 percent while flooding was cited in 67 percent of the communes surveyed Despite this in fully 58 percent of the communes farmers reported taking no action in response to floods In response to drought farmers reported switching to other crops in 16 percent of the communes and changed planting dates in 19 percent while only 7 percent of the communes reported no adaptation in farming practices These findings indicate the need for intervention to help farmers deal with floods in particular and to determine whether strategies for adapting to drought are the best suited to mitigate crop loss
