**Machine Learning in Chemistry** Hugh M Cartwright, 2020-07-15 Progress in the application of machine learning ML to the physical and life sciences has been rapid A decade ago the method was mainly of interest to those in computer science departments but more recently ML tools have been developed that show significant potential across wide areas of science There is a growing consensus that ML software and related areas of artificial intelligence may in due course become as fundamental to scientific research as computers themselves Yet a perception remains that ML is obscure or esoteric that only computer scientists can really understand it and that few meaningful applications in scientific research exist This book challenges that view With contributions from leading research groups it presents in depth examples to illustrate how ML can be applied to real chemical problems Through these examples the reader can both gain a feel for what ML can and cannot so far achieve and also identify characteristics that might make a problem in physical science amenable to a ML approach This text is a valuable resource for scientists who are intrigued by the power of machine learning and want to learn more about how it can be applied in their own field *Chemical Reactions* Antonio Laganà, Gregory A. Parker, 2018-01-17 This graduate textbook written by experienced lecturers features the study and computation of efficient reactive processes The text begins with the problem of determining the chemical reaction properties by first decomposing complex processes into their elementary components Next the problem of two colliding mass points is investigated and relationships between initial conditions and collision outcomes are discussed The failure of classical approaches to match experimental information is discussed and a quantum formulation of the calculation of the properties of two colliding bodies is provided The authors go onto describe how the formalism is extended to structured collision partners by discussing the methods used to compute the electronic structure of polyelectronic reactants and products and the formalism of atom diatom reactions Additionally the relationships between the features of the potential energy surface and the outcomes of the reactive dynamics are discussed Methods for computing quantum classical and semi classical reactive probabilities based on the already discussed concepts and tools are also featured and the resulting main typical reactive behaviors are analyzed Finally the possibility of composing the computational tools and technologies needed to tackle more complex simulations as well as the various competences and distributed computing infrastructure needed for developing synergistic approaches to innovation are presented
