

EXPERIMENT NO. 1

Aim : Preparation of :

- (I) a true solution of common salt, sugar and alum.
- (II) a suspension of soil, chalk powder and fine sand in water.
- (III) a colloidal solution of starch in water and egg albumin/milk in water and distinction between these on the basis of :
 - transparency
 - filtration criterion
 - stability

Concept & Theory :

A true solution is a homogeneous mixture of two or more substances (or of a solute and a solvent). Of the substances, the one which is present in the largest amount is called the solvent. The other substance present in a smaller quantity is called the solute.

Solubility : The maximum amount of a solute dissolved in 100 g of a solvent under a particular condition of temperature and pressure is the solubility of the solute in that solvent under the specified conditions.

Saturation : When no more solute can be dissolved in a solvent at the given condition of temperature and pressure, the solution is said to be saturated or to have reached the saturation point.

In a solution, the solute may be completely soluble, partially solution, or completely insoluble. Depending on the dispersion of a solute in a solvent, the resultant solution may be homogeneous (solution) or heterogeneous material (a suspension or a colloid).

Objectives :

To perform a set of experiments in order to understand the characteristics (transparency, filterability, stability) of and the differences among a true solution, suspension, and a colloid.

Before We Start–Take Precautions :

Handle acids and strong agents carefully.

Use a glass rod dipped in a funnel to direct the path of content when filtering a solution through filter paper.

Do not shake test tubes at all during the stability test period.

(I) Preparation of a true solution of common salt, sugar and alum

Materials (Assemble the following on your work-bench before you start) :

Apparatus	Chemicals/Agents
Beakers x 3	Distilled water
Glass rod x 1	10 g common salt (powder)
	10 g sugar (powder)
	10 g alum (powder)

Procedure :

1. In three beakers, add 90 ml water each, and label the beakers as A, B and C.
2. Add 10 g of finely powdered common salt, sugar and alum in beakers A, B and C respectively.
3. Stir the contents of each beaker using a glass rod and set aside until further use.
4. This solution is a true solution.

(II) Preparation of a suspension of soil, chalk powder and fine sand in water

Materials (Assemble the following on your work-bench before you start) :

Apparatus	Chemicals/Agents
Beakers x 3	Distilled water
Glass rod x 1	10 g fine soil
	10 g chalk powder
	10 g fine sand
